International Conference on Computer Applications - Database Systems , Preserving Privacy in Data Outsourcing Sara Foresti,2010-10-05 Privacy requirements have an increasing impact on the realization of modern applications Commercial and legal regulations demand that privacy guarantees be provided whenever sensitive information is stored processed or communicated to external parties Current approaches encrypt sensitive data thus reducing query execution efficiency and preventing selective information release Preserving Privacy in Data Outsourcing presents a comprehensive approach for protecting highly sensitive information when it is stored on systems that are not under the data owner s control The approach illustrated combines access control and encryption enforcing access control via structured encryption This solution coupled with efficient algorithms for key derivation and distribution provides efficient and secure authorization management on outsourced data allowing the data owner to outsource not only the data but the security policy itself To reduce the amount of data to be encrypted the book also investigates data fragmentation as a possible way to protect privacy of data associations and provide fragmentation as a complementary means for protecting privacy associations broken by fragmentation will be visible only to users authorized by knowing the proper key to join fragments The book finally investigates the problem of executing queries over possible data distributed at different servers and which must be controlled to ensure sensitive information and sensitive associations be visible only to parties authorized for that Case Studies are provided throughout the book Privacy data mining data protection data outsourcing electronic commerce machine learning professionals and others working in these related fields will find this book a valuable asset as well as primary associations such as ACM IEEE and Management Science This book is also suitable for advanced level students and researchers concentrating on computer science as a secondary text or reference book

Distributed Database Systems W. Cellary, T. Morzy, E. Gelenbe, 2014-06-28 Distributed Database Systems DDBS may be defined as integrated database systems composed of autonomous local databases geographically distributed and interconnected by a computer network The purpose of this monograph is to present DDBS concurrency control algorithms and their related performance issues The most recent results have been taken into consideration A detailed analysis and selection of these results has been made so as to include those which will promote applications and progress in the field The application of the methods and algorithms presented is not limited to DDBSs but also relates to centralized database systems and to database machines which can often be considered as particular examples of DDBSs The first part of the book is devoted to basic definitions and models the distributed database model the transaction model and the syntactic and semantic concurrency control models The second discusses concurrency control methods in monoversion DDBSs the locking method the timestamp ordering method the validation method and hybrid methods For each method the concept the basic algorithms a hierarchical version of the basic algorithms and methods for avoiding performance failures are given The third section covers concurrency control methods in multiversion DDBSs and the fourth methods for the semantic concurrency model The last part concerns performance issues of DDBSs The book is intended primarily for DDBMS designers but is also of use to those who are engaged in the design and management of databases in general as well as in problems of distributed system management such as distributed operating systems and computer networks

Distributed Database Management Systems

Saeed K. Rahimi, Frank S. Haug, 2010-07-16 This book addresses issues related to managing data across a distributed database system. It is unique because it covers traditional database theory and current research explaining the difficulties in providing a unified user interface and global data dictionary. The book gives implementers guidance on hiding discrepancies across systems and creating the illusion of a single repository for users. It also includes three sample frameworks implemented using J2SE with JMS, J2EE and Microsoft Net that readers can use to learn how to implement a distributed database management system. IT and development groups and computer sciences software engineering graduates will find this guide invaluable.

Readings in Database Systems Joseph M. Hellerstein, Michael Stonebraker, 2005 The latest edition of a popular text and reference on database research with substantial new material and revision covers classical literature and recent hot topics. Lessons from database research have been applied in academic fields ranging from bioinformatics to next generation Internet architecture and in industrial uses including Web based e commerce and search engines. The core ideas in the field have become increasingly influential. This text provides both students and professionals with a grounding in database research and a technical context for understanding recent innovations in the field. The readings included treat the most important issues in the database area, the basic material for any DBMS professional. This fourth edition has been substantially updated and revised with 21 of the 48 papers new to the edition, four of them published for the first time. Many of the sections have been newly organized and each section includes a new or substantially revised introduction that discusses the context, motivation and controversies in a particular area, placing it in the broader perspective of database research. Two introductory articles never before published provide an organized current introduction to basic knowledge of the field: one discusses the history of data models and query languages and the other offers an architectural overview of a database system. The remaining articles range from the classical literature on database research to treatments of current hot topics including a paper on search engine architecture and a paper on application servers both written expressly for this edition. The result is a collection of papers that are seminal and also accessible to a reader who has a basic familiarity with database systems.

Transactions and Database Dynamics Gunter Saake, Kerstin Schwarz, Can Türker, 2003-06-26 These post proceedings contain the revised versions of the accepted papers of the international workshop Transactions and Database Dynamics which was the eighth workshop in a series focusing on foundations of models and languages for data and objects FoMLaDO. Seven long papers and three short papers were accepted for inclusion in the proceedings. The papers address various issues of transactions and database dynamics: criteria and protocols for global snapshot isolation in federated transaction management, unified theory of concurrency control and replication control, specification of evolving information.
