

Worded Problem with Sinusoidal Functions

Andrew records musical sound waves of a particular note. He notices that the data fits a sinusoidal function $f(x) = a \sin(bx) + c$ where $0 \leq x \leq 360$ is the time in seconds.

This is the following data:

Coordinate	Property
(18, 8)	First maximum
(54, 4)	First minimum

Find the values of a , b , and c and describe what they means within the context.

$$54 - 18 = 36$$

$$\text{Period} = 72$$

$$\text{Period} = \frac{360}{b}$$

$$72 = \frac{360}{b} \quad \} \quad b = \frac{360}{72}$$

Equations and Analytical Tools in Mathematical Physics Yichao Zhu, 2021-10-04 This book highlights a concise and readable introduction to typical treatments of partial differential equations in mathematical physics Mathematical physics is regarded by many as a profound discipline In conventional textbooks of mathematical physics the known and the new pieces of knowledge often intertwine with each other The book aims to ease readers struggle by facilitating a smooth transition to new knowledge To achieve so the author designs knowledge maps before each chapter and provides comparative summaries in each chapter whenever appropriate Through these unique ways readers can clarify the underlying structures among different equations and extend one's vision to the big picture The book also emphasizes applications of the knowledge by providing practical examples The book is intended for all those interested in mathematical physics enabling them to develop a solid command in using partial differential equations to solve physics and engineering problems in a not so painful learning experience **Practical Signal Processing And Its Applications: With Solved Homework Problems** Sharad R

Laxpati, Vladimir Goncharoff, 2017-12-15 This textbook gives a fresh approach to an introductory course in signal processing

Its unique feature is to alternate chapters on continuous time analog and discrete time digital signal processing concepts in a parallel and synchronized manner. This presentation style helps readers to realize and understand the close relationships between continuous and discrete time signal processing and lays a solid foundation for the study of practical applications such as the analysis and design of analog and digital filters. The compendium provides motivation and necessary mathematical rigor. It generalizes the Fourier transform to Laplace and Z transforms, applies these transforms to linear system analysis, covers the time and frequency domain analysis of differential and difference equations, and presents practical applications of these techniques to convince readers of their usefulness. MATLAB examples are provided throughout, and over 100 pages of solved homework problems are included in the appendix.

Fourier Transforms in NMR, Optical, and Mass Spectrometry A.G. Marshall, F.R. Verdun, 2016-02-25. Written by spectroscopists for spectroscopists, here is a book which is not only a valuable handbook and reference work but also an ideal teaching text for Fourier transform methods as they are applied in spectroscopy. It offers the first unified treatment of the three most popular types of FT spectroscopy with uniform notation and complete indexing of specialized terms. All mathematics is self-contained and requires only a knowledge of simple calculus. The main emphasis is on pictures and physical analogs rather than detailed algebra. Instructive problems presented at the end of each chapter offer extensions of the basic treatment. Solutions are given or outlined for all problems. The book offers a wealth of practical information to spectroscopists. Non-ideal effects are treated in detail: noise source and detector limited, non-linear response limits to spectrometer performance based on finite detection period, finite data size, misphasing, etc. Common puzzles and paradoxes are explained, e.g., use of mathematically complex variables to represent physically real quantities, interpretation of negative frequency signals on resonance vs off-resonance response, interpolation when it helps and when it doesn't, ultimate accuracy of the data, differences between linearly and circularly polarized radiation, multiplex advantage or disadvantage, etc. Chapter 1 introduces the fundamental line shapes encountered in spectroscopy from a simple classical mass on a spring model. The Fourier transform relationship between the time domain response to a sudden impulse and the steady-state frequency domain response (absorption and dispersion spectra) to a continuous oscillation is established and illustrated. Chapters 2 and 3 summarize the basic mathematics (definitions, formulas, theorems, and examples) for continuous analog and discrete digital Fourier transforms and their practical implications. Experimental aspects which are common to the signal (Chapter 4) and noise (Chapter 5) in all forms of Fourier transform spectrometry are followed by separate chapters for treatment of those features which are unique to FT-MS, FT-optical, FT-NMR, and other types of FT spectroscopy. The list of references includes both historical and comprehensive reviews and monographs along with articles describing several key developments. The appendices provide instant access to FT integrals and fast algorithms as well as a pictorial library of common Fourier transform function pairs. The comprehensive index is designed to enable the reader to locate particular key words, including those with more than one name.
