## Efficiency and Technical Progress

As indicated in the preceding chapter, economic performance in the long run is measured here and technical progress is measured in terms of society's technology. Clearly, to evaluate economic performance it is essential to have some well-defined objectives. The index to evaluate is how that production technology performs over time. It is important to have a conceptual tool that identifies the costs and benefits to society of that law.

The two dimensions of economic performance to be discussed here were selected to be the best measure of efficiency and technical progress. In a sense, these descriptive terms should be used and dynamic efficiency—how fast the traditional sector is able to be converted into the modern sector. The main distinction is that in discussing efficiency it will be assumed that the technology is given, and in discussing technical progress the assumption is that innovation are being allocated to developing new technologies (the producing old products have already met the producing capacity new products).

## Economic Efficiency

We begin by considering the theoretical world of perfect competition. Every entrepreneur has identical access to the perfectly competitive market. The key assumptions are:

1. Consumers are perfectly informed about all goods, all of which are private goods.
2. Producers have production functions that take one increasing return to scale and factor-bounded inputs.
3. Consumers maximize their preferences given budget constraints; producers maximize profits given their production functions.
4. All agents are price takers, and transactions among agents are costless.
5. A competitive equilibrium, that is, a set of prices such that all markets clear, is then determined.

An important feature of these conditions that follows from the preceding assumptions is that the competitive equilibrium is Pareto optimal. In short, the equilibrium cannot be improved by requiring any one agent to increase the welfare of some other agent without harming others. An important property of the equilibrium in this price-taking model is that it is efficient.

That is, the ideal competitive world that we have described would have no need for government intervention in the marketplace, except for policies affecting income distribution. This leads to some problems of income distribution—how to share income in the total of private income (which includes taxation and transfer payments).

Many of the basic assumptions will be relaxed and discussed in detail throughout the book. Of course, the key assumptions to be discussed in this part of the book is the price-taking

## Chapter 3

It should be recalled that any process engaged in competition, in the course of such competition, has the right to refuse or accept a distribution to prices which is preferred by the market.
