Comparison between Protective Transformer and Instrument Transformer and Power Transformer:-

Protective Transformers	Instrument Transformers
1. At the time of fault large current flow to prevent core saturation, core of large size is used & partially for fast acting relay air gap is provided so as to have linear operating region. 2. In this error permissible if of the order of 10% compensative error at fault current level. 3.operates on or above the knee point region 4.output current changes with change in fault current	1. No such problem so, core of smaller size is used and no air gap is there. 2. Both phase angle and ratio errors are important. 3. Operates linearly up to 120% of full load current or voltage & saturated beyond that. 4. Output is proportional to load current/voltage but saturate above 120% of rated value
Power Transformer	**Current Transformer**
1. It transfers power from one voltage level to another on other side. 2. Primary current depend on secondary current. 3. It should not operate on saturation region during fault current.	1. It steps down current from higher value. 2. Secondary current depends on primary current. 3.at the time of the fault it operates on saturation region
