Biostimulants in Agriculture Youssef Roupheal, Giuseppe Colla, 2020-03-24 *Agricultural Index*, 1964 Nematodes as Model Organisms Itamar Glazer, David I. Shapiro-Ilan, Paul W. Sternberg, 2022-05-16 Nematodes are small multicellular organisms that have been used as biological models since the 1960s For example *Caenorhabditis elegans* is a free living nematode worm about 1mm in length that lives in temperate soil environments It is made up of about 1000 cells and has a short life cycle of only two weeks It was the first multicellular organism to have its whole genome sequenced The book summarizes the importance of nematodes as model organisms in the fields of genetics developmental biology neurobiology pharmacology nutrition ecology and parasitology Of interest to a broad audience across a wide spectrum of disciplines this book is useful for biologists working on comparative studies to investigate biological processes across organisms medical scientists and pharmacologists for exploration of drugs and medicine including the use of genome editing to eliminate diseases ecologists considering nematodes as indicators for environment changes and parasitologists for host parasite interactions Many other researchers can use this book as a benchmark for the broad implications of nematology research on other aspects of science **Climate Impacts on Agricultural and Natural Resource Sustainability in Africa** Bal Ram

Doonan, Marcos Egea-Cortines, 2018-11-08 Phenomics is an emerging area of research whose aspiration is the systematic measurement of the physical physiological and biochemical traits the phenome belonging to a given individual or collection of individuals Non destructive or minimally invasive techniques allow repeated measurements across time to follow phenotypes as a function of developmental time These longitudinal traits promise new insights into the ways in which crops respond to their environment including how they are managed To maximize the benefit these approaches should ideally be scalable so that large populations in multiple environments can be sampled repeatedly at reasonable cost Thus the development and validation of non contact sensing technologies remains an area of intensive activity that ranges from Remote Sensing of crops within the landscape to high resolution at the subcellular level Integration of this potentially highly dimensional data and linking it with variation at the genetic level is an ongoing challenge that promises to release the potential of both established and under exploited crops

Pollination Ecology and the Rain Forest David Roubik, Shoko Sakai, Abg Abdul

Hamid, 2006-03-30 Rain Forest Biology and the Canopy System Sarawak 1992 2002 The rain forest takes an immense breath and then exhales once every four or five years as a major global weather pattern plays out usually heralded by El Niño Southern Oscillation While this powerful natural cycle has occurred for many millennia it is during the past decade that both the climate of Earth and the people living on it have had an increasing influence on the weather pattern itself with many biological consequences In Southeast Asia as also in most of the Neotropics El Niño accompanies one of the most exuberant outpourings of nature's diversity After several years of little activity the incredibly diverse rain forests suddenly burst into flower a phenomenon referred to as General Flowering in Asia Plant populations are rejuvenated and animals are fed but the process involves a delicate and complex balance When the canopy access system was under construction at Lambir Hills National Park in the early 1990s it made use of an underlying technology that was already in place bridges For centuries bridges have spanned the natural chasms over rivers This existing network of bridges and the people who built and use them produced the technology we needed to gain access to the canopy Bridge builders were our natural allies in the quest for biological knowledge of the high canopy

Plant-Soil Interactions at Low pH Robert J. Wright, V.C. Baligar, R. Paul Murrmann, 2012-12-06 Soil acidity is a major limitation to crop production in many parts of the world Plant growth inhibition results from a combination of factors including aluminum manganese and hydrogen ion toxicities and deficiencies of essential elements particularly calcium magnesium phosphorus and molybdenum Agricultural management practices and acid precipitation have increased acid inputs into the ecosystem and heightened concern about soil acidity problems While application of lime has proved to be effective in ameliorating

surface soil acidity in many areas significant soil acidity problems still exist Scientists from Alberta Canada recognized the need to provide a forum for researchers from different disciplines to exchange information and ideas on solving problems of plant growth in acid soils As a result of their efforts the First International Symposium on Plant Soil Interactions at Low pH was held at Grande Prairie Alberta Canada in July 1987 In many acid soil areas liming materials are not readily available the cost may be prohibitive or subsoil acidity cannot be corrected by surface application of lime New management approaches involving both the plant and the soil are needed in these situations Progress has been made in the selection and breeding of acid tolerant plants However continued progress will be limited by our lack of understanding of the physiological and biochemical basis of differential acidity tolerance among plants
