INTRODUCTION

In the [Population Dynamics](#) Click & Learn, you'll explore a powerful tool for learning about populations: mathematical models. As you'll see by doing the Click & Learn and this activity, you can use models to answer questions, solve problems, and make predictions about all kinds of populations — from bacteria in your body, to wildlife across the world, to our own human populations.

PART 1: Introduction to Population Dynamics

Open the [Population Dynamics](#) Click & Learn and read through the introduction on the first page.

1. Describe a specific question or problem related to population dynamics that interests you.

I would be curious about the growth and sustainability of the human population in the long term.

2. Do you think the question or problem you described could be investigated using a mathematical population model? Why or why not?

We could likely use the demographic transition model as it measures birth and death rates along with carrying capacity.

PART 2: Exploring the Exponential Growth Model

Open the "Exponential growth model" tab and read the "Introduction" section.

3. The end of the "Introduction" describes how you could use a continuous-time, exponential growth model to simulate an *E. coli* population growing in a lab. Describe another specific population and situation that you could simulate with this type of model.

Other bacteria, populations in recovery from a disaster, or populations in ideal conditions for reproduction.

4. Complete the following table to explain the *biological* meanings of the symbols in the exponential growth model. For each explanation, give a specific example using the population you described above.

Symbol	Biological Meaning	Specific Example
N	The number in the population	how many bacteria are in the population
t	Time we are using as a measure	1 day
dN/dt	The change in population size over the change in reproduction time	In one day, there was an increase from x bacteria to y bacteria
r	Rate of reproduction	1.1 bacteria per minute.
N_0	Initial population	There were initially z bacteria

5. Both dN/dt and r are types of growth rates. What are the differences between them?

While the first represents population growth rates as a whole, r is based more in birth/death rates per

The Role of Population Games in the Design of Optimization-Based Controllers Julian Barreiro-Gomez, 2018-08-01 This book reports on the implementation of evolutionary game theory in the design of distributed optimization based controllers First it discusses how the classical population game approach can contribute to and complement the design of optimization based controllers It shows how the features of this approach can be exploited to extend their capabilities in the solution of distributed optimization problems and examines density games in order to consider multiple coupled constraints and preserve the non centralized information requirements Furthermore it establishes a close relationship between the possible interactions among agents in a population with constrained information sharing among different local controllers It also discusses coalitional games focusing on the Shapley power index and proposes an alternative method of computing the latter which reduces computational time as well as a different way of finding it using distributed communication structures All the proposed strategies are then tested on various control problems such as those related to the Barcelona water supply network multiple continuous stirred tank reactors various unmanned aerial vehicle systems and a water distribution system This thesis examined at the Universitat Politècnica de Catalunya and Universidad de los Andes in 2017 received the award for best thesis in control from the control group of the Spanish Committee of Automatic Control CEA in the same year

Behavior and Ecology of the Northern Fur Seal Roger L. Gentry, 2014-07-14 Covering the behavior and ecology of the northern fur seal this book is a model long term study of marine mammals one that tests theory through both observation of undisturbed behavior and manipulative experiments on individuals Here Roger Gentry draws on nearly two decades of research on three different islands to show how behavior among these seals changes with population size sex ratio and environment to explain the behavior of the population beginning with individuals and to generalize the results to other members of the eared seal family In so doing he offers one of the most comprehensive studies of its kind on any marine mammal species to date Gentry shows that the species is driven by very different behavioral traits than have been assumed for it in the past His book analyzes behavior on scales of hours to lifetimes investigates the mating system considers processes that underlie the mating system site fidelity behavioral estrus and the development of territoriality and addresses specific aspects of maternal strategy female attendance behavior pup growth seasonal influences and the effects of continental shelf width Gentry contributes to knowledge about marine mammals by providing a very specific basis for interspecies comparisons and he suggests a link between population trend and environmental regime shifts He also guides the debate over seal mating systems from an interpretive to an
