Swaco Degasser Manual:

Drilling Fluids Processing Handbook ASME Shale Shaker ASME Shale Shaker Committee, 2011-03-15 Written by the Shale Shaker Committee of the American Society of Mechanical Engineers originally of the American Association of Drilling Engineers the authors of this book are some of the most well respected names in the world for drilling The first edition *Shale Shakers and Drilling Fluid Systems* was only on shale shakers a very important piece of machinery on a drilling rig that removes drill cuttings The original book has been much expanded to include many other aspects of drilling solids control including chapters on drilling fluids cut point curves mud cleaners and many other pieces of equipment that were not covered in the original book Written by a team of more than 20 of the world's foremost drilling experts from such companies as Shell Conoco Amoco and BP There has never been a book that pulls together such a vast array of materials and depth of topic coverage in the area of drilling fluids Covers quickly changing technology that updates the drilling engineer on all of the latest equipment fluids and techniques **Mud Equipment Manual**, 1982 Drilling Practices Manual Preston L. Moore, 1986 Blowout of the Mexican Oil Well Ixtoc I United States. Congress. House. Committee on Merchant Marine and Fisheries, 1980 **Risk Analysis for Offshore Structures and Equipment** Commission of the European Communities, 1987 By its very nature action involves risk zero risk is zero action Man has always had a sense of action hence risk and consequently of the precautions required to ensure his safety As with all techniques development was first pursued in an empirical even rudimentary fashion and so it has continued until very recently Naturally these empirical safety procedures could not survive the dual explosion of major technological and social conscience The shift towards rational analytical procedures for risk assessment and safety assurance naturally began in aeronautical projects followed by the nuclear and aerospace fields In recent years these procedures have also been applied to other types of activity the building of chemical complexes European gas storage facilities etc More recently still we have seen direct and explicit assessment of the risk associated with petroleum operations particularly offshore and high risk transportation industrial waste liquefied gas with regard to navigation in the vicinity of sensitive installations located near the coast Risk implies the concept of probability if there were some means of ensuring absolute avoidance of a given risk then it would clearly no longer exist The modern perception of risk may be regarded as a shift from a deterministic philosophy to a probabilistic view of human enterprise see J M Planeix *Le risque une notion subjective differemment perque* Risk a differently perceived subjective concept IABSE paper on collisions between shipping platforms and bridges Copenhagen June 1983 We might also note the advent of statistical philosophy in modern studies in the economic field for example Mensch *Stalemate in Technology* The increase in the degree of risk associated with exploration for hydrocarbons at ever greater depths offshore and under severe environmental conditions has been duly perceived by operators who have accentuated the trend towards the use of analytical procedures in safety assessment Risk analysis may be applied to the whole of a field or platform or to a particular isolated

system within a structure Structures are increasingly being analysed by modern probabilistic procedures providing an explicit assessment of structural safety Where a process of risk analysis is applied to a given unit the probabilistic study of structural safety forms part of the general analysis It is important to note parallel to the development and use of modern procedures for structural analysis that European industry has for the past six years been pursuing a vast programme of investigation into fatigue and cracking in steels used for offshore platforms this programme being supported by the ECSC This extremely important point will be examined in greater detail in our conclusions and will be covered by certain recommendations To take maximum advantage of the extremely interesting results so far obtained from this programme it is essential first for structures to be analysed according to modern procedures and then for this analysis to be introduced into a global study of a given unit Monitoring the integrity of structures for example requires the use of inspection resources forming part of the general organization of a field The results thus obtained must be translated into a plan of action in the event that serious damage is revealed Procedures for studying systems by the fault tree method enable the safety cost balance to be assessed and are consequently used as an aid to decision making They are the only procedures allowing an explicit study of this balance of manifest importance for the present and future A safety cost balance is the essential element in decision making for insurance companies though in most cases today this balance is the result of experience In the report following experts have been questioned on the application of risk analysis in the nuclear aerospace and offshore fields The general ideas expressed by these experts are contained in the body of the report with technical details in the appendices There is of course a certain lack of uniformity in the contributions made by these experts and to some extent a degree of overlap we nevertheless felt that to eliminate this lack of uniformity and overlap would be prejudicial to the report We briefly summarize below the opinions of the experts on the degree of penetration of risk analysis methods in the industrial sectors examined in this report
