

Selection and Speciation

How can changes in a population result in the formation of a new species?

Why?

Have you ever wondered how the great diversity of life on Earth has come about or how a single new species formed? Environmental pressures may cause populations to change over time or evolve. This is because an organism's ability to live or reproduce in its current environment will determine its reproductive success and ability to pass on its genes. But changes within a population can occur without creating a new species. At what point do scientists start thinking of a new species for a species?

Model 1 – Three Types of Selection

1. What variables do the graphs in Model 1 compare?
2. What are the three types of selection illustrated in the graphs in Model 1?

Speciation and Its Consequences Daniel Otte, John A. Endler, 1989 Genetics of Speciation David L. Jameson, 1977
The nature of populations races subspecies and species Genetic basis of isolation Origin of isolation theoretical Origin of isolation experimental The nature of the speciation process **Endless Forms** Daniel J. Howard, Stewart H. Berlocher, 1998
Speciation is one of the great themes of evolutionary biology It is the process through which new species are born and diversity generated Yet for many years our understanding of the process consisted of little more than a perception that if populations are isolated geographically they will diverge genetically and may come to form new species This situation began to change in the 1960s as an increasing number of biologists challenged the exclusivity of allopatric speciation and began to probe more deeply into the actual process by which divergence occurs and reproductive isolation is acquired This focus on process led to many new insights but numerous questions remain and speciation is now one of the most dynamic areas of research in modern evolutionary biology This volume presents the newest research findings on speciation bringing readers up to day on species concepts modes of speciation and the nature of reproductive barriers It also discusses the forces that drive divergence of populations the genetic control of reproductive isolation and the role played by hybrid zones and hybridization in speciation **Speciation** ,2001 **Modes of Speciation** Michael James Denham White, 1978

Speciation Pawel Michalak, 2013 The origin of species or speciation the mystery of mysteries as Charles Darwin called it is an issue at the very heart of evolutionary biology critical to understanding the mechanisms behind the great diversity of life around us This book is centred around three major research areas 1 biodiversity patterns in relation to speciation scenarios 2 mechanisms that produce pre and postzygotic reproductive isolation and adaptive divergence as well as 3 genetics epigenetics and genomics of speciation Being a mishmash of new ideas reviews conventional and nonconventional case studies this collection demonstrates more than anything how research can benefit from integration of traditionally divergent disciplines such as biogeography paleontology taxonomy molecular genetics proteomics and genomics *Frogs, Flies, and Dandelions* Menno Schilthuizen, 2001 How do new animal and plant species come about How quickly does it happen And what are species anyway Schilthuizen reputed scientist and journalist launches into the debate that has baffled biologists ever since Darwin with tremendous energy and wit The whole subject leaps to life and its significance for understanding biodiversity comes clear This is a fascinating read that will appeal equally to the lay reader and to students getting to grips with the fundamentals of a complex subject **Speciation** Jerry A. Coyne, H. Allen Orr, 2004 Over the last two decades the study of speciation has expanded from a modest backwater of evolutionary biology into a large and vigorous discipline Thus the literature on speciation as well as the number of researchers and students working in this area has grown explosively Despite these developments there has been no book length treatment of speciation in many years As a result both the seasoned scholar and the newcomer to evolutionary biology had no ready guide to the recent literature on speciation a

body of work that is enormous scattered and increasingly technical Although several excellent symposium volumes have recently appeared these collections do not provide a unified critical and up to date overview of the field Speciation is designed to fill this gap Aimed at professional biologists graduate students and advanced undergraduates Speciation covers both plants and animals the first book on this subject to do so and deals with all relevant areas of research including biogeography field work systematics theory and genetic and molecular studies It gives special emphasis to topics that are either controversial or the subject of active research including sympatric speciation reinforcement the role of hybridization in speciation the search for genes causing reproductive isolation and mounting evidence for the role of natural and sexual selection in the origin of species The authors do not hesitate to take stands on these and other controversial issues This critical and scholarly book will be invaluable to researchers in evolutionary biology and is also ideal for a graduate level course on speciation

Genes, Categories, and Species Jody Hey, 2001-07-19 This book is a thorough re examination of the species problem the continuing disagreement among biologists about how best to identify species and what constitutes useful and genuine biological divisions of groups and organisms This book contributes to our understanding of the scientific issues related to the species concept through an exploration of the reality of biological diversity and of the mental processes behind the ways we recognize species and how we establish typological categories generally The text develops a theory of evolutionary groups groups of DNAs that compete and share in genetic drift and adaptation and revisits the major issues of modern phylogeny systematics and evolutionary biology through this framework

Systematics and the Origin of Species, from the Viewpoint of a Zoologist Ernst Mayr, 1964 **Animal Species and Evolution** Ernst Mayr, 1963 This masterly and long awaited work is a full exposition synthesis summation and critical evaluation of the present state of man s knowledge about the nature of animal species and of the part they play in the processes of evolution In a series of twenty chapters Mr Mayr presents a consecutive story beginning with a description of evolutionary biology and ending with a discussion of man as a biological species Calling attention to unsolved problems and relating the evolutionary subject matter to appropriate material from other fields such as physiology genetics and biochemistry the author integrates and interprets existing data Believing that an unequivocal stand is more likely to produce constructive criticism than evasion of an issue he does not hesitate to choose that interpretation of a controversial matter which to him seems most consistent with the emerging picture of the evolutionary process Between the terminal points mentioned above Mr Mayr pursues the narrative through discussions of species concepts and their application morphological species characters and sibling species biological properties of species isolating mechanisms hybridization the variation and genetics of populations storage and protection of genetic variation the unity of the genotype geographic variation the polytypic species of the taxonomist the population structure of species kinds of species multiplication of species geographic speciation the genetics of speciation the ecology of speciation and species and transspecific evolution The volume provides a valuable glossary and an inclusive bibliography greatly extends its range for those who wish to investigate special aspects of the material **Animal Species and Evolution** is presented as a permanent entity In accordance with the author s feeling that the acquisition of new knowledge will require a new statement rather than an emendation of a previous one no substantive revisions of this volume are planned for future printings Because of the impossibility of experimenting with man and because an understanding of man s biology is indispensable for safeguarding his future emphasis throughout this book is placed on

those findings from the higher animals which are directly applicable to man In his final chapter on hominids and the various forms of Homo Mr Mayr comes to the conclusion that while modern man appears to be just as well adapted for survival purposes as were his ancestors there is much evidence to suggest that he is threatened by the loss of his most typically human characteristics It would be within his power to reverse this tendency **Selection, sex, speciation and species**
