Speed Control Three Phase Induction Motor

Robert Everett Turkington

Speed Control Three Phase Induction Motor:

Speed Control of Three-phase Induction Motor Using Variable Frequency Drive Sagarkumar Patel,2018 Abstract There are various methods for speed control of induction motors This paper specifically describes one of the methods speed control using variable frequency The proposed system is a MATLAB simulink model which is a closed loop model designed to achieve desired speed control of a three phase induction motor by varying its frequency The simulink model has four main blocks namely the inverter synchronous machine proportional integral control and current hysteresis control For accuracy of output results and simplicity we have used dq to abc transformation block and sin function block The inverter is comprised of six integrated gate bipolar transistors IGBTs which are fired by gate pulses generated by current hysteresis control block The inverter generates variable frequency and variable voltage output which is given to motor terminals The project presents the working principle of variable frequency drive VFD its performance and the use of Pulse Width Modulation PWM in a three phase inverter to control the frequency and thus the speed The proposed method conformed to performance predictions and delivered the desired outputs

Speed Control of a Three-phase Induction Motor by a Thyatron Inverter Robert Everett Turkington,1951 *Fuzzy Logic Based Speed Control of Three-Phase Induction Motor Drive* Obinna Anyim,2017-06-19 Conventional controllers like the proportional integral differential PID would have being very effective not just for speed control alone if not for some complexities with individually controlling its respective controllers and summing up their individual contributions to effectively yield controlled signal output Also for its insensitivity to changes made to model parameters which may be as a result of misrepresentation of some control variables As a result of this developing an intelligent based fuzzy logic controller FLC became eminent and on this basis this book is written By varying the motor speed with input reference speed an error signal and a feedback loop is generated The FLC then operates on the principles of mapping with corrective measure of the error signal generated and it is regulated by sets of IF THEN rules integrating the Mamdani fuzzy inference approach The rules projected and formed are used to overcome the drawbacks of conventional controllers Since induction motors are widely used in many industries today most especially squirrel caged an intelligent approach to the control of these motors will save cost increase reliability and efficiency

Speed Control of Three Phase Ac Induction Motor Using Svm Farrukh Rashid,Mohsin Waqar,Umar Tabrez Shami,2014-09-03 The project we have chosen to implement Space Vector Modulation is very important form industrial point of view It is not uncommon to control the speed of induction motors according to the load demand attached with the motor There are different techniques to fulfill this demand Most common techniques are PWM techniques Every PWM technique has its own advantage and sometimes drawback So we the group members have implemented a control for induction motor which can control the speed of motor very effectively and

efficiently SVM is different from other conventional PWM techniques in that it sees the inverter as a single unit and results in high efficiency high reliability smoother operation higher fundamental output voltage So this technique is preferred over the other techniques due to its desirable features

BASICS OF ELECTRICAL MACHINES SURYAMANI MISHRA, Today electrical energy is the most widely used form of energy for performing several industrial commercial and domestic functions such as pumping water fans coolers air conditioning refrigeration etc Since most of processes require the conversion of electrical energy into mechanical energy Also the mechanical energy is converted into electrical energy Hence this clears that we need a mechanism to convert the electrical energy into mechanical energy and mechanical energy into electrical energy and such a mechanism is known as electromechanical energy conversion device Electrical machines are essential devices that convert energy from one form to another usable form They can be broadly classified into three categories Generators Motors and Transformers Generators transform mechanical energy into electrical energy motors convert electrical energy into mechanical energy and transformers alter voltage levels in AC systems forming the backbone of a power system Electrical machines are integral to domestic appliances commercial devices and industrial applications For students of electrical engineering understanding the
