

About the GeoExplorer 6000 series handheld

The GeoExplorer 6000 series includes the GeoXH™ and GeoXT™ handhelds. These handhelds combine a Trimble GNSS receiver with a field computer powered by Microsoft Windows Mobile version 6.5 operating system.

The GeoExplorer 6000 series handheld has built-in Bluetooth® wireless technology for cable-free connection to other devices, and Wi-Fi connectivity for connections to networks. In addition, some GeoExplorer 6000 series handheld editions are equipped with a wireless cellular modem for downloading and transmitting data over the Internet.

The GeoXT handheld uses EVEREST™ multipath rejection technology to provide submeter accuracy. The GeoXH handheld uses both EVEREST and H-Star™ technology to provide decimeter (10 cm) accuracy, either in real time or after postprocessing. In addition, both the GeoXH and GeoXT handhelds are compatible with Trimble Floodlight™ satellite shadow reduction technology for improved productivity in conditions where sky view is obstructed by buildings, trees, or landscape features. For more information, see [Chapter 5, Using the GNSS Receiver](#).

Supported GNSS field software

To collect GNSS data with the GeoExplorer 6000 series handheld, you must install GNSS field software onto the handheld. You can use the GeoExplorer 6000 series handheld with the following GNSS field software:

- Trimble TerraSync™ software, for configuring real-time differential correction options and for productive GIS data collection and maintenance.
- The Trimble GPSCorrect™ extension for Esri ArcPad software, for configuring real-time differential correction options and for productive GIS data collection and maintenance.
- Trimble GPS Controller software, for configuring real-time differential correction options and NMEA output settings.
- Other GNSS field software that accepts NMEA messages. To use NMEA Output messages, you must purchase and activate the NMEA output option. See [Activating the Floodlight technology and the NMEA output options, page 74](#)

Arkansas s diverse geography spanning the Ozark Mountains densely forested Timberlands and Mississippi River Delta and its complex Native American and Euro American history belie the inattentive historical treatment the Natural State has thus far received by scholars Often disparaged as a cultural and intellectual backwater and indeed perhaps best known for President Bill Clinton and Wal Mart this overly simplified image of Arkansas shadows a state rich in historic significance and the archaeological record Carl G Drexler aims to correct this bias in Historical Archaeology of Arkansas In nine essays that range from Civil War sites to the Ozark Mountains to the nineteenth century Jewish community Drexler and his contributors

present an Arkansas unknown to all but those dedicated individuals working to publicize the state's hidden diversity. The research presented herein depicts a strong state and federal commitment to documenting Arkansas's history perhaps unmatched by any other state in America and the success of public archaeology through the efforts of the Arkansas Archaeological Survey. Historical Archaeology of Arkansas not only showcases the natural beauty and rich history of Arkansas but it also serves as a primer for historical inquiry for other state and federal organizations looking to bolster their own programs. Carl G. Drexler is the Archaeological Survey's station archaeologist for southwest Arkansas and a research assistant professor with the University of Arkansas. His articles have appeared in *Archaeology* and *Historical Memory*. *Historical Archaeology*, *American Antiquity* and *Field Notes*. Forestry Applications of Unmanned Aerial Vehicles (UAVs) 2019 Alessandro Matese, 2020-11-23. Unmanned aerial vehicles (UAVs) are new platforms that have been increasingly used in the last few years for forestry applications that benefit from the added value of flexibility, low cost, reliability, autonomy, and capability of timely provision of high resolution data. The main adopted image-based technologies are RGB, multispectral, and thermal infrared. LiDAR sensors are becoming commonly used to improve the estimation of relevant plant traits. In comparison with other permanent ecosystems, forests are particularly affected by climatic changes due to the longevity of the trees, and the primary objective is the conservation and protection of forests. Nevertheless, forestry and agriculture involve the cultivation of renewable raw materials with the difference that forestry is less tied to economic aspects and this is reflected by the delay in using new monitoring technologies. The main forestry applications are aimed toward inventory of resources, map diseases, species classification, fire monitoring, and spatial gap estimation. This Special Issue focuses on new technologies, UAV and sensors, and innovative data elaboration methodologies, object recognition, and machine vision for applications in forestry.
