Ten Lectures on Statistical and Structural Pattern Recognition M.I. Schlesinger, Václav Hlaváč, 2013-03-09 Preface to the English edition This monograph Ten Lectures on Statistical and Structural Pattern Recognition uncovers the close relationship between various well known pattern recognition problems that have so far been considered independent These relationships became apparent when formal procedures addressing not only known problems but also their generalisations were discovered The generalised problem formulations were analysed mathematically and unified algorithms were found The book unifies of two main streams in pattern recognition the statistical and structural ones In addition to this bridging on the uppermost level the book mentions several other unexpected relations within statistical and structural methods The monograph is intended for experts for students as well as for those who want to enter the field of pattern recognition The theory is built up from scratch with almost no assumptions about any prior knowledge of the reader Even when rigorous mathematical language is used we make an effort to keep the text easy to comprehend This approach makes the book suitable for students at the beginning of their scientific career Basic building blocks are explained in a style of an accessible intellectual exercise thus promoting good practice in reading mathematical

text The paradoxes beauty and pitfalls of scientific research are shown on examples from pattern recognition Each lecture is amended by a discussion with an inquisitive student that elucidates and deepens the explanation providing additional pointers to computational procedures and deep rooted errors

Algorithmic Principles of Mathematical Programming Ulrich Faigle,W. Kern,G. Still,2013-04-17 Algorithmic Principles of Mathematical Programming investigates the mathematical structures and principles underlying the design of efficient algorithms for optimization problems Recent advances in algorithmic theory have shown that the traditionally separate areas of discrete optimization linear programming and nonlinear optimization are closely linked This book offers a comprehensive introduction to the whole subject and leads the reader to the frontiers of current research The prerequisites to use the book are very elementary All the tools from numerical linear algebra and calculus are fully reviewed and developed Rather than attempting to be encyclopedic the book illustrates the important basic techniques with typical problems The focus is on efficient algorithms with respect to practical usefulness Algorithmic complexity theory is presented with the goal of helping the reader understand the concepts without having to become a theoretical specialist Further theory is outlined and supplemented with pointers to the relevant literature

Dynamic Analysis of Petri Net-Based Discrete Systems Andrei Karatkevich,2007-04-27 Design of modern digital hardware systems and of complex software systems is almost always connected with parallelism For example execution of an object oriented program can be considered as parallel functioning of the co operating objects all modern operating systems are multitasking and the software tends to be multithread many complex calculation tasks are solved in distributed way But designers of the control systems probably have to face parallelism in more evident and direct way Controllers rarely deal with just one controlled object Usually a system of several objects is to be controlled and then the control algorithm naturally turns to be parallel So classical and very deeply investigated model of discrete device Finite State Machine is not expressive enough for the design of control devices and systems Theoretically in most of cases behavior of a controller can be described by an FSM but usually it is not convenient such FSM description would be much more complex than a parallel specification even as a network of several communicating FSMs

Computer Safety, Reliability and Security Wolfgang Ehrenberger, 1998-09-23. Computers and their interactions are becoming the characteristic features of our time. Many people believe that the industrial age is going over into the information age. In the same way as life at the beginning of this century was dominated by machines, factories, streets and railways, the starting century will be characterised by computers and their networks. This change naturally affects also the institutions and the installations our lives depend upon: power plants including nuclear ones, chemical plants, mechanically working factories, cars, railways and medical equipment; they all depend on computers and their connections. In some cases it is not human life that may be endangered by computer failure but large investments, e.g. if a whole plant interrupts its production for a long time. In addition to loss of life and property, one must not neglect public opinion, which is very critical in many countries against major technical defects. The related computer technology, its hardware, software and production process differ between standard applications and safety-related ones. In the safety case, it is normally not only the manufacturers and the customers that are involved but a third party, usually an assessor who is taking care of the public interest on behalf of a state authority. Usually, safety engineers are in a better position than their colleagues from the conventional side as they may spend more time and money on a particular task and use better equipment.
