

2. Probabilities of sequences.

Assume that the four bases A, C, T, and G occur with equal likelihood in a DNA sequence of nine monomers.

- (a) What is the probability of finding the sequence AAATCGAGT through random chance?
- (b) What is the probability of finding the sequence AAAAAAAAAA through random chance?
- (c) What is the probability of finding any sequence that has four A's, two T's, two G's, and one C, such as that in (a)?

- (a) Each base occurs with probability $1/4$. The probability of an *A* in position 1 is $1/4$, of *A* in position 2 is $1/4$, of *A* in position 3 is $1/4$, of *T* in position 4 is $1/4$, and so on. There are 9 bases. The probability of this specific sequence is $(1/4)^9 = 3.8 \times 10^{-6}$.
- (b) Same answer as (a) above.
- (c) Each specific sequence has the probability given above, but in this case there are many possible sequences which satisfy the requirement that we have 4 *A*'s, 2 *T*'s, 2 *G*'s, and 1 *C*. How many are there? We start as we have done before, by assuming all nine objects are distinguishable. There are $9!$ arrangements of nine distinguishable objects in a linear sequence. (The first one can be in any of nine places, the second in any of the remaining eight places, and so on.) But we can't distinguish the four *A*'s, so we have overcounted by a factor of $4!$, and must divide this out. We can't distinguish the two *T*'s, so we have overcounted by $2!$, and must also divide this out. And so on. So the probability of having this composition is

$$\left[\frac{9!}{4!2!2!1!} \right] \left(\frac{1}{4} \right)^9 = 0.014.$$

Reservoir Engineering Manual D. Nathan Meehan,Eric L. Vogel,1982 Minimum Volumetric Requirements in Aerated Drilling Godwin A. Okpobiri,Carlos J. Machado,Chi U. Ikoku,1982 This Field Operations Manual provides drilling engineers a means of making quick graphical determinations of gas air and liquid volumetric requirements in air foam and mist drilling A model for predicting correct air gas volume requirements in air drilling has been developed It includes a complete analysis of pressures throughout the system offers flexibility in selection of wellhead pressure and air flow rate and is primarily graphical Charts are presented for sandstone shale and limestone formations A model has also been developed for predicting minimum volumetric requirements for foam and mist drilling operations It accounts for frictional losses due to the solid phase pressure drop across bit nozzles and particle settling velocities The technique offers a high degree of flexibility in the selection of wellhead injection pressures and volumetric requirements Actual field application of this work can be accomplished by two different methods depending on compressor specifications These are the Variable Back pressure and Constant Back Pressure schedules They are primarily graphical The main advantage of these techniques over the currently practiced trial and error methods in aerated drilling is the prevention of the use of excess air gas and or foamer solution while the hole is still in gauge If these results can be realized problems such as hole enlargement sloughing shale and wellbore collapse can be minimized and drilling costs will be reduced All of the charts presented in this manual assume regular bits with nozzles of 28 32 inches each For large bit nozzle sizes used in aerated drilling pressure drop across such nozzles is negligible in comparison to total system losses Thus the charts are also applicable to conditions where no nozzles are involved *Fossil Energy Update* ,1983 **Scientific and Technical Aerospace Reports** ,1979 Lists citations with abstracts for aerospace related reports obtained from world wide sources and announces documents that have recently been
