Abstract: *gambusia holbrooki* (Linn.) and *Gambusia affinis* (Boulenger) were introduced to the city of Moscow, Russia, in 1935. Since that time, they have been widely distributed in the city and its surrounding areas. The present study was conducted to determine the distribution of these two species in the city of Moscow and its surrounding areas. The results of the study show that *G. holbrooki* is more common in the city of Moscow, while *G. affinis* is more common in the surrounding areas. The study also found that both species are able to tolerate a wide range of environmental conditions, including high temperatures and low oxygen levels. This suggests that these two species are well adapted to the urban environment of Moscow.

1. The first step in the process of identifying a problem is to define the problem. This involves identifying the symptoms of the problem and determining the scope of the problem. Once the problem has been defined, the next step is to identify the causes of the problem. This involves identifying the factors that are contributing to the problem and determining the underlying causes. Once the causes have been identified, the next step is to develop a plan of action. This involves identifying the steps that need to be taken to solve the problem and determining the resources that will be needed to implement the plan. Finally, the last step in the process is to implement the plan and monitor the results. This involves putting the plan into action and tracking the progress of the solution. Once the problem has been solved, the final step is to evaluate the results and determine if the solution was effective.
