Linear Differential Equations and Oscillators Luis Manuel Braga da Costa Campos, 2019-11-05 Linear Differential Equations and Oscillators is the first book within Ordinary Differential Equations with Applications to Trajectories and Vibrations Six volume Set. As a set, they are the fourth volume in the series Mathematics and Physics Applied to Science and Technology. This first book consists of chapters 1 and 2 of the fourth volume. The first chapter covers linear differential equations of any order whose unforced solution can be obtained from the roots of a characteristic polynomial, namely those i) with constant coefficients ii) with homogeneous power coefficients with the exponent equal to the order of derivation. The method of characteristic polynomials is also applied to iii) linear finite difference equations of any order with constant coefficients. The unforced and forced solutions of i) ii) iii) are examples of some general properties of ordinary differential equations. The second chapter applies the theory of the first chapter to linear second order oscillators with one degree of freedom, such as the mechanical mass damper spring force system and the electrical self resistor capacitor battery circuit. In both cases, free undamped damped and amplified oscillations, also forced oscillations including beats, resonance, discrete and continuous spectra, and impulsive inputs are described. General properties of differential and finite difference equations with focus on linear equations and constant and some power coefficients are presented. Particular and general solutions for all cases of differential and finite difference equations are provided. Complete solutions for many cases of forcing, including resonant cases, are discussed. Applications to linear second order mechanical and electrical oscillators with damping are provided. Solutions with forcing, including resonance using the characteristic polynomial, Green's functions, trigonometrical series, Fourier integrals, and Laplace transforms are provided.
