Abstract The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and blood pressure (BP) of sedentary, middle-aged men. The subjects were divided into two groups: a control group and a training group. The control group consisted of 10 men who did not exercise, and the training group consisted of 10 men who exercised for 12 weeks. The HR and BP were measured at baseline and at the end of the 12-week period. The results showed that the training group had a significant decrease in HR and BP compared to the control group. The HR decreased from 72 to 68 beats per minute, and the BP decreased from 120/80 to 110/70 mmHg. The control group showed no significant change in HR and BP. The results suggest that a 12-week training program can effectively reduce HR and BP in sedentary, middle-aged men.

Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were randomly assigned to a control group (CG) and an exercise group (EG). The EG performed a 10-week training program consisting of three sessions per week of aerobic and resistance exercise. The CG performed no exercise. The HR and EE were measured at baseline and at the end of the 10-week training program. The EG showed a significant decrease in HR and a significant increase in EE compared to the CG. The results suggest that a 10-week training program can improve the cardiovascular fitness and energy expenditure of sedentary, middle-aged women.
