Abstract: The purpose of this study was to determine the effect of a 12-week resistance training program on the strength and endurance of the lower extremities of sedentary, middle-aged men. The subjects were divided into two groups: a control group and an experimental group. The experimental group performed a 12-week resistance training program, while the control group remained sedentary. The results showed that the experimental group had significantly greater strength and endurance than the control group at the end of the 12-week period.
