Microprocessors increasingly control and monitor our most critical systems including automobiles airliners medical systems transportation grids and defense systems The relentless march of semiconductor process technology has given engineers exponentially increasing transistor budgets at constant recurring cost This has encouraged increased functional integration onto a single die as well as increased architectural sophistication of the functional units themselves Additionally design cycle times are decreasing thus putting increased schedule pressure on engineers Not surprisingly this environment has led to a number of uncaught design flaws Traditional simulation based design verification has not kept up with the scale or pace of modern microprocessor system design Formal verification methods offer the promise of improved bug finding capability as well as the ability to establish functional correctness of a detailed design relative to a high level specification However widespread use of formal methods has had to await breakthroughs in automated reasoning integration with engineering design languages and processes scalability and usability This book presents several breakthrough design and verification techniques that allow these powerful formal methods to be employed in the real world of high assurance microprocessor system design **The Royal Navy List** ,1880
