

Double Stem System

(b) For the 60 by 45 cm, only one strong and dominant shoot is left to grow and bear fruits. All other shoots are desuckered in time.

2. Outdoor Methods

(a) Staking Method

- In this method, 5-6 ft long stakes are used to support the plant vertically at 60 cm intervals.
- Both single and double stem systems can be used.

(b) Passion fruit method

- Here strong stakes 9 ft high are erected above on which a strong wire, preferably barbed wire is run from post to post.
- Prune to either single stem or double stem.

(c) Hedge type method

- The idea is to maximise production within a small period of time. The crop is planted at 60 by 60 cm and left to grow on 2 branches.
- The weak branches are removed in time.
- Each branch is nipped at a height of 1.5-2 meters which is 5-7 trusses.
- The supporting is done by setting strong stakes on which double stringing is done to support the tomato from all sides to look like a hedge, (snow peas system.)

General Management of pest and diseases

Pests and diseases remain the greatest challenge in Tomato production. Appropriate and timely management makes all the difference between good production, poor production or total crop failure. Proper identification of the pest and disease is critical in a control strategy.

The general principles in pests and disease management include:

- **Practicing crop rotation.** Observe minimum 2 year rotation program
- **Planting resistant /tolerant varieties** - Use certified disease-free seed treated with an approved fungicide to control seed rots and post emergence damping off
- **Field hygiene**-old crop should be removed from the fields, control weeds and crop debris since these are source of pests and diseases. Staking and pruning are also key to disease incidence reduction.
- **Using proper crop production practices** that provide the right growing conditions for plants (sufficient water and balanced fertilization), particularly when crops are young. Strong healthy plants are more likely to withstand pests and diseases.
- **Irrigation management;** poor irrigation timing and scheduling may lead to disease, overhead irrigation in the evenings can encourage early blight.
- **Ensure regular crop scouting** for pest and disease as well as weed and nutrient deficiencies. Proper pest and diseases identification is the first and critical step in their management. This helps to detect problems early and take control measures on time.

NOTE: Use registered products at the recommended rates observing the PPE; Refer to product label.

MAJOR TOMATO PESTS

The greenhouse whitefly (*Trialeurodes vaporariorum*)

This pest is serious as it has a very high multiplication rate, the whitefly larvae stages are also difficult to control with conventional contact products. The pest populations build up rapidly due to a life cycle of 20-days or less. Greenhouse Whitefly is a key vector to various viral diseases such as Tomato Yellow Leaf Curl Virus. They usually cause stunting and growth of sooty mould. Poor fruit are formed. The pest is known to transmit viruses.

Control of whiteflies

Physical control –use of nets and double doors, sticky traps and destruction of infested debris, registered pesticide products can also be used.

Leaf miner (*Liriomyza huidobrensis*)

The adult leaf miner causes damage on the leaves with the feeding marks. The larvae tunnel the leaf reducing the photosynthesis area and often destroying the leaf. Heavy infestation can lead to loss of leaves and even death of the plant. When leaves are damaged the yield for that plant will be direct affected.

Control of Leaf miners

Biological control using *Diglyphus*, disease and cultural control such as burying plant residues. For insecticide use refer to table (pg 13).
