Human cancer is a complex and heterogeneous group of diseases characterized by uncontrolled cell growth and proliferation. Post-translational modifications (PTMs) of proteins play a critical role in cancer development and progression. PTMs are chemical modifications that occur after a protein is synthesized and can significantly impact the function, localization, stability, and activity of proteins within a cell. Pharmacology is a field of medicine that focuses on the study of drugs and their effects on the human body. Pharmacological interventions that target PTMs are a promising area of cancer research and treatment. For example, PARP Inhibitors: Poly ADP-ribose polymerase (PARP) inhibitors are a class of drugs that exploit defects in DNA repair mechanisms, particularly in cells with BRCA mutations. These inhibitors target the PARP protein, which plays a role in DNA repair through PTM processes. PARP inhibitors like olaparib and rucaparib have been approved for the treatment of ovarian and breast cancers. Ubiquitin-Proteasome System (UPS) Inhibitors: The UPS is responsible for the degradation of specific proteins tagged with ubiquitin. Some drugs, such as bortezomib, inhibit the UPS, leading to the accumulation of ubiquitinated proteins and apoptosis in cancer cells. SUMOylation Inhibitors: Small ubiquitin-like modifier (SUMO) modification is a PTM that regulates the activity of various proteins. Recent research has explored the development of SUMOylation inhibitors to target specific cancer-related proteins. These are still in the experimental stage. The effectiveness of these treatments varies depending on the specific cancer type, genetic mutations, and individual patient characteristics. It is important to note that the development and application of these therapies often require a deep understanding of the specific PTMs and their roles in the molecular pathways of different cancer types. Additionally, personalized medicine approaches are becoming increasingly common, tailoring treatments based on the unique PTM profiles and genetic mutations of individual patients' tumors. Personalized medicine, also known as precision medicine, is being pursued in cancer treatment for several compelling reasons and offers several benefits compared to more traditional one-size-fits-all approaches. Personalized medicine offers targeted treatment, increased treatment efficacy, reduced side effects, and optimized drug selection among many other benefits. This research topic will focus on post-translational modifications (PTMs) and their role in human cancer within the field of pharmacology. This is a highly relevant and significant area of study as understanding how PTMs contribute to cancer development and progression is critical for the development of targeted pharmacological interventions. We welcome contributions in the form of Original Research Articles, Reviews, and Mini Reviews that cover but are not limited to the following topics: a) Post-Translational Modifications (PTMs) in Cancer Molecular Mechanisms; b) Pharmacological Approaches Targeting PTMs in Cancer; c) Personalized Medicine and PTM Profiles; d) Emerging Trends and Future Directions. Please note that if patient data are analyzed, a comprehensive description of the patients, including sex, age, diagnostic criteria, inclusion and exclusion criteria, disease stage, therapy received, comorbidities, as well as

additional clinical information and assessment of clinical response effects should be included If genetic proteomics metabolomics or other omics data are analyzed a comprehensive description of the methods and the rationale for the selection of the specific data studied should be provided Studies related to natural compounds herbal extracts or traditional medicine products will not be included in this Research Topic Studies solely based on the analysis of public databases or published evidence with no further experimental insights or experimental validation will not be included in this Research Topic

Molecular Mechanisms of Cilia Related Diseases Joao Goncalves, Sara Carvalhal, Anne-Marie Tassin, Bruno Carmona, 2024-05-29. Eukaryotic cilia are evolutionarily conserved microtubule-based structures that protrude from the cell surface. In vertebrates, multiple motile and primary immotile cilia fulfill sensory and motility functions that are critical for embryonic development and the homeostasis of adult tissues. Cilia malfunction has been shown to cause a growing number of diseases presenting phenotypes such as brain and skeletal developmental problems, intellectual disability, blindness, infertility, obesity, and kidney cysts. Despite their clinical relevance, we are still far from fully understanding the basic biology of these multiple cilia types. For example, we do not know the molecular compositions of all types of cilia nor how cilia structural and functional diversity is generated. Also, we are still identifying the genetic causes of ciliopathies and the impact of mutations on ciliary protein function, cilia biogenesis, maintenance, ciliary functions, and disease development. Understanding all these aspects concerning vertebrate cilia will greatly contribute to the design of innovative therapeutic approaches for cilia-related disorders. Understanding the basic biology of vertebrate cilia is critical for the understanding of cilia-related disorders. However, there are still many open questions about these organelles. For example, we do not know the proteomes and protein-protein interaction networks specific of each cilium type. Also, the function of ciliary proteins is often studied mostly in vitro and in the context of primary cilia. This limits our possibility to answer questions like why does a certain disease mutation affect only certain types of cilia in specific tissues. Therefore, this Research Topic aims to address these issues and focus on the latest findings on the basic biology of vertebrate cilia such as their molecular composition and biogenesis pathways and also on advances on our understanding of the molecular mechanisms of ciliopathies. The goal of this Research Topic is to cover novel research focused on furthering our understanding on the molecular mechanisms underlying

the development of cilia associated diseases Areas to be covered in this Research Topic may include but are not limited to Identification of novel cilia related diseases Genetic causes of ciliopathies Molecular mechanisms of disease and development of therapeutic approaches Molecular composition of vertebrate cilia Molecular mechanisms of vertebrate cilia biogenesis and multiple functions Original research articles as well as review articles are welcomed Cardiovascular Remodeling Yan Yang,Yi Zhang,Ming Lei,Gui-Rong Li,2023-08-25 Although the treatment has greatly progressed the mortality of cardiovascular diseases remains the leading cause of death worldwide Serious cardiovascular diseases e g myocardial infarction heart failure cardiac dysrhythmias and stroke are resulted from cardiovascular remodeling secondary to the cardiovascular risk factors including hypertension atherosclerosis cigarette smoking diabetes mellitus hyperlipidemia aging etc Cardiac remodeling involves a series of molecular cellular and interstitial alterations which manifest clinically as changes in size mass geometry and function of the heart In addition vascular remodeling is an active process of structural alteration involving vascular wall thickening and lumen stenosis due to endothelial injury vascular smooth muscle cell proliferation and matrix deposition This results in atherosclerosis and or stenosis followed by myocardial infarction stroke etc Thus studies on the mechanism of cardiovascular remodeling and new therapeutic approaches are important scientifically and clinically Cardiovascular remodeling is a response of specific cardiovascular cells including cardiomyocytes endothelial smooth muscle cells and interstitial cells to noxious hemodynamic metabolic and inflammatory stimuli The remodeling may initially be functional compensatory and adaptive but it progresses to structural alterations that become pathogenic when the damaging stimuli are sustained The mechanism of cardiovascular remodeling is complex and recent studies focus on improving and or reversing the remodeling by clarifying molecular mechanisms and identifying novel therapies Pharmacological anti remodeling RNA based long non coding RNA and microRNA treatment cell based iPS cardiac repair and cell free exosome approaches have been shown to improve cardiovascular remodeling alongside proangiogenic pro survival proliferative and immunogenic factors stimulating endogenous proliferative potential of cardiomyocytes However though advanced studies have progressed the prognosis of the affected patients remains poor Therefore understanding novel mechanisms identifying remodeling biomarkers and developing new therapeutic drugs and approaches can lead to new therapeutic options for treating patients with cardiovascular diseases Prentice Hall Science Explorer Michael J.
