The Neurology of Neuroblastoma Nina Felice Schor, 2012-12-06 Neuroblastoma is the single most common solid tumor of childhood. Although children with small primary neuroblastomas alone are almost always cured by surgery, 65% of children with neuroblastoma already have large bulky tumors or metastatic disease by the time of initial diagnosis. For these children, the 5 year survival rate is only somewhere between 5% and 20% with therapies including surgery, radiation, chemotherapy, and bone marrow transplantation. Dr. Schor outlines a new approach to these tumors in order to make a difference for these children. There is much information to support the notion that neuroblastomas represent a developmental aberration of the nervous system rather than a de novo abnormality in a previously normal cell. While the remote paraneoplastic effects of neuroblastoma are often the purview of the child neurologist, the neoplasm itself has been viewed and approached therapeutically in much the same manner as all other solid tumors as the purview of the pediatric oncologist. This work takes the view that approaching neuroblastoma rather as a disorder of nervous system development offers new therapeutic possibilities for this common tumor of childhood.

Arrival of the Fittest Andreas Wagner, 2015-10-06 Wagner draws on over fifteen years of research to present the missing piece in Darwin's theory. Using experimental and computational technologies that were heretofore unimagined, he has found that adaptations are not just driven by chance but by a set of laws that allow nature to discover new molecules and mechanisms in a fraction of the time that random variation would take. The Circadian Clock Urs Albrecht, 2010-01-23 With the invitation to edit this volume, I wanted to take the opportunity to assemble reviews on different aspects of circadian clocks and rhythms. Although most contributions in this volume focus on mammalian circadian clocks, the historical introduction and comparative clocks section illustrate the importance of various other organisms in deciphering the mechanisms and principles of circadian biology. Circadian rhythms have been studied for centuries but only recently a molecular understanding of this process has emerged. This has taken research on circadian clocks from mystic phenomenology to a mechanistic level. Chains of molecular events can describe phenomena with remarkable accuracy. Nevertheless, current models of the functioning of circadian clocks are still rudimentary. This is not due to the faultiness of discovered mechanisms but due to the lack of undiscovered processes involved in contributing to circadian rhythmicity. We know, for example, that the general circadian mechanism is not regulated equally in all tissues of mammals. Hence, a lot still needs to be discovered to get a full understanding of circadian rhythms at the systems level. In this respect, technology has advanced at high speed in the last years and provided us with data illustrating the sheer complexity of regulation of physiological processes in organisms. To handle this information, computer-aided integration of the results is of utmost importance in order to discover novel concepts that ultimately need to be tested experimentally.

Structure, function, and plasticity of hippocampal dentate gyrus microcircuits Peter Jonas, John Lisman, 2015-02-13 The hippocampus mediates several higher brain functions such as learning memory and spatial coding The input region of the hippocampus the dentate gyrus plays a critical role in these processes Several lines of evidence suggest that the dentate gyrus acts as a preprocessor of incoming information preparing it for subsequent processing in CA3 For example the dentate gyrus converts input from the entorhinal cortex where cells have multiple spatial fields into the spatially more specific place cell activity characteristic of the CA3 region Furthermore the dentate gyrus is involved in pattern separation transforming relatively similar input patterns into substantially different output patterns Finally the dentate gyrus produces a very sparse coding scheme in which only a very small fraction of neurons are active at any one time How are these unique functions implemented at the level of cells and synapses Dentate gyrus granule cells receive excitatory neuron input from the entorhinal cortex and send excitatory output to the hippocampal CA3 region via the mossy fibers Furthermore several types of GABAergic interneurons are present in this region providing inhibitory control over granule cell activity via feedback and feedforward inhibition Additionally hilar mossy cells mediate an excitatory loop receiving powerful input from a small number of granule cells and providing highly distributed excitatory output to a large number of granule cells Finally the dentate gyrus is one of the few brain regions exhibiting adult neurogenesis Thus new neurons are generated and functionally integrated throughout life How these specific cellular and synaptic properties contribute to higher brain functions remains unclear One way to understand these properties of the dentate gyrus is to try to integrate experimental data into models following the famous Hopfield quote Build it and you understand it However when trying this one faces two major challenges First hard quantitative data about cellular properties structural connectivity and functional properties of synapses are lacking Second the number of individual neurons and synapses to be represented in the model is huge For example the dentate gyrus contains 1 million granule cells in rodents and 10 million in humans Thus full scale models will be complex and computationally demanding In this Frontiers Research Topic we collect important information about cells synapses and microcircuit elements of the dentate gyrus We have put together a combination of original research articles review articles and a methods article We hope that the collected information will be useful for both experimentalists and modelers We also hope that the papers will be interesting beyond the small world of dentology i e for scientists working on other brain areas Ideally the dentate gyrus may serve as a blueprint helping neuroscientists to define strategies to analyze network organization of other brain regions

Mr. Bernds Goes to Hollywood Edward Bernds, 1999-04-29 Edward Bernds came to Hollywood in 1928 to help United Artists make the transition to sound He worked with some of the most notable directors in Hollywood including Frank Capra Leo McCarey and Howard Hawks Though Bernds loved sound work he had higher aspirations and hoped to become a writer and director His first breakthrough came during the mid 1940s on Columbia shorts starring the Three Stooges Bernds worked with Moe Larry Curly Shemp and company for over twenty years as the Stooges

favorite director A second breakthrough came when he wrote and directed feature length films among them the science fiction classics *World Without End* *Return of the Fly* *Spacemaster X7* and *Zsa zsa Gabor s Queen of Outer Space* Edward Bernds witnessed all of the profound changes that Hollywood underwent from the advent of sound to the start of the Easy Rider era Fortunately for students and fans of film he tells his story in this fascinating and vivid account of his life in Hollywood

Sapir, 1999-12-10 This volume contains papers which are based primarily on talks given at an international conference on Algorithmic Problems in Groups and Semigroups held at the University of Nebraska Lincoln from May 11 May 16 1998 The conference coincided with the Centennial Celebration of the Department of Mathematics and Statistics at the University of Nebraska Lincoln on the occasion of the one hundredth anniversary of the granting of the first Ph D by the department Funding was provided by the US National Science Foundation the Department of Mathematics and Statistics and the College of Arts and Sciences at the University of Nebraska Lincoln through the College's focus program in Discrete Experimental and Applied Mathematics The purpose of the conference was to bring together researchers with interests in algorithmic problems in group theory semigroup theory and computer science A particularly useful feature of this conference was that it provided a framework for exchange of ideas between the research communities in semigroup theory and group theory and several of the papers collected here reflect this interaction of ideas The papers collected in this volume represent

a cross section of some of the results and ideas that were discussed in the conference They reflect a synthesis of overlapping ideas and techniques stimulated by problems concerning finite monoids finitely presented mono ids finitely presented groups and free groups

Advances in Neural Information Processing Systems 12 Sara A. Solla,Klaus-Robert Müller,Todd K. Leen,2000 The annual conference on Neural Information Processing Systems NIPS is the flagship conference on neural computation It draws preeminent academic researchers from around the world and is widely considered to be a showcase conference for new developments in network algorithms and architectures The broad range of interdisciplinary research areas represented includes computer science neuroscience statistics physics cognitive science and many branches of engineering including signal processing and control theory Only about 30 percent of the papers submitted are accepted for presentation at NIPS so the quality is exceptionally high These proceedings contain all of the papers that were presented
