Technical Analysis And Financial Asset Forecasting: From Simple Tools To Advanced Techniques Raymond Hon-fu Chan, Alan Wing-keung Wong, Spike Tsz-ho Lee, 2014-08-19. Technical analysis is defined as the tracking and prediction of asset price movements using charts and graphs in combination with various mathematical and statistical methods. More precisely, it is the quantitative criteria used in predicting the relative strength of buying and selling forces within a market to determine what to buy, what to sell, and when to execute trades. This book introduces simple technical analysis tools like moving averages and Bollinger bands, and also advanced techniques such as wavelets and empirical mode decomposition. It first discusses some traditional tools in technical analysis such as trend line, trend channel, Gann's Theory, moving averages, and Bollinger bands. It then introduces a recent indicator developed for stock market and two recent techniques used in the technical analysis field: wavelets and the empirical mode decomposition in financial time series. The book also discusses the theory to test the performance of the indicators and introduces the MATLAB Financial Toolbox, some of the functions/codes of which are used in our numerical experiments.

One step at a time, you'll learn how to use them together to identify crucial reversal and confirmation signals more rapidly and reliably. Thomsett reviews how traditional and candlestick methods each identify patterns indicating future stock behavior and reversal, and shows how to use each system to gain cross confirmation and strengthen the reliability of your predictions. **Profiting from Technical Analysis and Candlestick Indicators** shows how to uncover reversal signals in both systems, how to use candlesticks and well known technical signals to forecast pricing, how to recognize signal failures and false leads, how to profit from Western and Eastern indicators in swing trading, and how to use them together to reduce risk.
