

variables, Z the vector of physical variables (e.g. agro-ecology), C the vector of socio-economic variables (e.g. distance to market) and P , the vector of input prices (Mendelson *et al.*, 1994). The farmer is presumed to choose X to maximize net revenues given the physical characteristics of farm and market price. This model is a reduced form that examines how different explanatory variables P , Z , and C affect net revenues. Normal Ricardian model depends on the following quadratic formula:

$$R = \beta_0 + \beta_1 P + \beta_2 P^2 + \beta_3 Z + \beta_4 C + \varepsilon \quad (2)$$

Where, ε is an error term. It presents both linear and quadratic regression for temperature and rainfall. The expected directional impact of single climate variable on net revenue estimated at the mean is:

$$E\left[\frac{\partial R}{\partial P}\right] = \beta_1 + 2\beta_2 P + \beta_3(Z/C) \quad (3)$$

The quadratic term reveals the nonlinear shape of net revenue of climate reaction function (Equation 2). Net revenue function indicates U-shaped when quadratic equation is positive and hill-shaped when quadratic equation is negative. The relationship between seasonal climate variables is difficult to predict and may contain a mixture of

positive and negative coefficients. The change in annual benefits (ΔR), a resultant from climate change from C0 to C1 can be defined as:

$$\Delta R = R(C1) - R(C0) \quad (4)$$

If climate change increases net revenue it will be useful and if climate change reduces net revenue it will be harmful. Observations across different climates of the season can reveal sensitivity of climate on crop yields. This study, therefore, used linear regression to estimate left net revenue to impacts of climate change.

Independent variables for regression model

Table 1 shows summary of independent variables in assessing impact of climate change on left net revenue. Left revenues are assumed to be a function of farm household characteristics (e.g. age, education), institutional support (e.g. farm to farm extension, formal extension services, access to formal credit), adaptation strategies, climate factors (e.g. temperature, rainfall), production factors (e.g. land size, seed, fertilizer, labor) and agro-ecological settings (e.g. highland, midland, lowland).

RESULTS AND DISCUSSION

Farmers perceptions to climate change

The results indicate 90% of farmers perceive increasing temperature, 5% decreasing temperature and 4% perceive no change as shown in Table 2. Similarly, 92% of farmers perceive decreasing rainfall, 3% increasing rainfall and 5% no change. In the past thirty years, increasing temperature and decreasing rainfall are leading perceptions among left farmers in the study area.

Life Cycle & Technoeconomic Modeling

Antonio Colmenar Santos, David Borge Diez, Enrique Rosales Asensio, 2020-12-02 This book aims to perform an impartial analysis to evaluate the implications of the environmental costs and impacts of a wide range of technologies and energy strategies. This information is intended to be used to support decision making by groups including researchers, industry regulators and policy makers. Life cycle assessment (LCA) and technoeconomic analysis can be applied to a wide variety of technologies and energy strategies, both established and emerging. LCA is a method used to evaluate the possible environmental impacts of a product, material, process or activity. It assesses the environmental impact throughout the life cycle of a system from the acquisition of materials to the manufacture, use and final disposal of a product. Technoeconomic analysis refers to cost evaluations including production cost and life cycle cost. Often in order to carry out technoeconomic analysis, researchers are required to obtain data on the performance of new technologies that operate on a very small scale in order to subsequently design configurations on a commercial scale and estimate the costs of such expansions. The results of the developed models help identify possible market applications and provide an estimate of long term impacts. These methods, together with other forms of decision analysis, are very useful in the development and improvement of energy objectives since they will serve to compare different decisions, evaluating their political and economic feasibility and providing guidance on potential financial and technological risks.

Cereals and Pulses Martin Brink, 2006

Handbook on Sourdough Biotechnology Marco Gobbetti, Michael Gänzle, 2023-04-24 Bread and leavened bakery products have been essential to human nourishment for millennia. Traditionally, bread production has relied on the use of sourdough as a leavening agent and to impart a characteristic quality to baked goods. In recent years, improved understanding of the biodiversity and microbial ecology of sourdough microbiota, the discovery of new species, the improved management and monitoring of its meta community, and the commercialization of innovative products have vastly expanded the potential of sourdough fermentation for making baked goods. For example, raw materials such as cereals, pseudo cereals, ancient grains, and gluten free substrates, as well as a large number of baked good varieties, e.g. typical and industrial breads, sweet baked goods, gluten free products, may benefit from advances in sourdough fermentation. In addition, biotechnological tools and culture properties have been discovered to improve both the shelf life and the sensory and textural qualities of baked goods, as well as their nutritional and health promoting properties. Now in its second edition, the *Handbook on Sourdough Biotechnology* remains the only book dedicated completely to sourdough biotechnology, with the contribution of the most experienced researchers from the field. It reviews the history of sourdough and the potential of sourdough fermentation in the production of bread and baked goods. A thorough discussion of the various processing steps includes the chemical properties of the raw matter, the taxonomy, diversity, and metabolic properties of starter yeasts and lactic acid bacteria, and the effects of sourdough fermentation on the shelf life and the sensory, textural, nutritional, and health promoting properties of baked goods.
