Spectral estimation is important in many fields including astronomy meteorology seismology communications economics speech analysis medical imaging radar sonar and underwater acoustics Most existing spectral estimation algorithms are devised for uniformly sampled complete data sequences However the spectral estimation for data sequences with missing samples is also important in many applications ranging from astronomical time series analysis to synthetic aperture radar imaging with angular diversity For spectral estimation in the missing data case the challenge is how to extend the existing spectral estimation techniques to deal with these missing data samples Recently nonparametric adaptive filtering based techniques have been developed successfully for various missing data problems Collectively these algorithms provide a comprehensive toolset for the missing data problem based exclusively on the nonparametric adaptive filter bank approaches which are robust and accurate and can provide high resolution and low sidelobes In this book we present these algorithms for both one dimensional and two dimensional spectral estimation problems Digital Signal Processing John G.
