

Introduction of Waterflooding

- The formula for overall waterflood oil-recovery efficiency E_R might be simply stated as the product of three independent terms:

$$E_R = E_D E_I E_A \quad \text{where} \quad \begin{aligned} E_D &= \text{the unit-displacement efficiency,} \\ E_I &= \text{the vertical-displacement efficiency,} \\ E_A &= \text{the areal-displacement efficiency} \end{aligned}$$

(Assuming independence of these three factors is not valid for real oil reservoirs)

- Waterflood is a dynamic process that lasts for several decades;
- Opportunities to modify the original waterflood design and operating guidelines on the basis of analysis of the actual field production data;
- Real-time monitoring of waterflood performance is required.
