Topics in Multidimensional Linear Systems Theory Eva Zerz, 2000-08-16 The past few decades have witnessed an increasing interest in the field of multidimensional systems theory This is concerned with systems whose trajectories depend not on one single variable usually interpreted as time or frequency but on several independent variables such as the coordinates of an image The behavioural approach introduced by J C Willems provides a particularly suitable framework for developing a linear systems theory in several variables. The book deals with the classical concepts of autonomy controllability observability and stabilizability All the tests and criteria given are constructive in the sense that algorithmic versions may be implemented in modern computer algebra systems using Gr bner basis techniques There is a close connection between multidimensional systems theory and robust control of one dimensional systems with several uncertain parameters The central link consists in the basic tool of linear fractional transformations. The book concludes with examples from the theory of electrical networks Design and Implementation of Symbolic Computation Systems Alfonso Miola, 1993-09-02 This volume constitutes the proceedings of the International Symposium on Design and Implementation of Symbolic Computation Systems DISCO 93 held in Gmunden Austria in September 1993 The growing importance of systems for symbolic computation has greatly influenced the decision of organizing this third conference in the series DISCO 93 focuses mainly on the most innovative methodological and technological aspects of the design and implementation of hardware and software systems for symbolic and algebraic computation automated reasoning geometric modeling and computation and automatic programming The general objective of DISCO 93 is to present an up to date view of the field and to serve as a forum insymbolic computation for the scientific exchange among academic industrial and user communities Besides invited talks by Buchberger Monagan Omodeo and Hong the volume contains 28 contributions carefully selected by a highly competent international program committee from a total of 56 submissions Recent Stability Issues for Linear Dynamical Systems Nicola Guglielmi, Christian Lubich, Nicolas Gillis, Volker Mehrmann, Punit Sharma, Bart Vandereycken, 2024-12-13 This book concerns matrix nearness problems in the framework of spectral optimization It addresses some current research directions in spectral based stability studies for differential equations with material on ordinary differential equations ODEs differential algebraic equations and dynamical systems Here stability is interpreted in a broad sense which covers the need to develop stable and reliable algorithms preserving some qualitative properties of the computed solutions methodologies which are helpful to assess the onset of potential instabilities or loss of robustness and tools to determine the asymptotic properties of the solution or its discretization The topics considered include the computation of robustness measures for linear problems the use of low rank ODEs to approximate such measures via gradient systems the regularity stability passivity and controllability analysis of structured linear descriptor systems and the use of acceleration techniques to deal with some of the presented computational problems Although the emphasis is on the numerical study of differential equations and dynamical

systems the book will also be of interest to researchers in matrix theory spectral optimization and spectral graph theory as well as in dynamical systems and systems theory

The brief discusses the design methods of the controllers based on the proposed approach for the vibration suppression of the intelligent structure. The brief also presents a design of discrete time reduced order observer using the duality to discrete time sliding surface design First the duality between the coefficients of the discrete time reduced order observer and the sliding surface design is established and then the design method for the observer using Riccati equation is explained Using the proposed method the observer for the Power System Stabilizer PSS for Single Machine Infinite Bus SMIB system is designed and the simulation is carried out using the observed states The discrete time sliding mode controller based on the proposed reduced order observer design method is also obtained for a laboratory experimental servo system and verified with the experimental results and Computational Optimal Control Kok Lay Teo, Bin Li, Changjun Yu, Volker Rehbock, 2021-05-24 The aim of this book is to furnish the reader with a rigorous and detailed exposition of the concept of control parametrization and time scaling transformation It presents computational solution techniques for a special class of constrained optimal control problems as well as applications to some practical examples The book may be considered an extension of the 1991 monograph A Unified Computational Approach Optimal Control Problems by K L Teo C J Goh and K H Wong This publication discusses the development of new theory and computational methods for solving various optimal control problems numerically and in a unified fashion To keep the book accessible and uniform it includes those results developed by the authors their students and their past and present collaborators A brief review of methods that are not covered in this exposition is also included

Knowledge gained from this book may inspire advancement of new techniques to solve complex problems that arise in the future This book is intended as reference for researchers in mathematics engineering and other sciences graduate students and practitioners who apply optimal control methods in their work It may be appropriate reading material for a graduate level seminar or as a text for a course in optimal control **Scientific and Technical Aerospace Reports**, 1987
