10 Chromosomes, Mitosis, and Meiosis

Key Concepts

10.1 In eukaryotic cells, DNA is wound around specific proteins to form chromatin, which in turn is folded and packaged to make individual chromosomes.

10.2 In mitosis, duplicated chromosomes separate (split apart) and are evenly distributed into two daughter nuclei. Mitosis is an important part of the cell cycle, which consists of the successive stages through which a cell passes.

10.3 An internal genetic program interacts with external signals to regulate the cell cycle.

10.4 Meiosis, which reduces the number of chromosome sets from diploid to haploid, is necessary to maintain the normal chromosome number when two cells join during sexual reproduction. Meiosis helps increase genetic variation among offspring.

10.5 Meiosis and gamete production precede fertilization in the life cycles of sexually reproducing organisms.

Learning Objectives

10-1 Discuss the significance of chromosomes in terms of their information content.

10-2 Explain how DNA is packed into chromosomes in eukaryotic cells.

10-3 Identify the stages in the eukaryotic cell cycle and describe their principal events.

10-4 Describe the structure of a duplicated chromosome, including the sister chromatids, centromeres, and kinetochores.

10-5 Explain the significance of mitosis and describe the process.
