Scientific and Technical Aerospace Reports, 1995 Numerical Modelling of Construction Processes in Geotechnical Engineering for Urban Environment Theodoros Triantafyllidis, 2006-02-23 It has become increasingly important particularly in an urban environment to predict soil behaviour and to confine the settlement or deformation of buildings adjacent to construction sites One important factor is the choice of construction procedure for

the installation of piles sheet pile walls anchors or for soil improvement techniques ground freezing and tunnelling methods The modelling of construction processes which are frequently associated with large deformations of the soil and with strong changes in the structure of the soil around the construction plant in the case of for example a drill a bit a vibrator or an excavation tool requires sophisticated and new methods in numerical modelling Often the simulation of the construction procedure is neglected in the calculations Such methods are described and discussed in this book as are examples of the methods applied to geotechnical practice field and laboratory testing as well as case studies This volume provides a valuable source of reference for scientists in geotechnical engineering and numerical modelling geotechnical engineers post graduate students construction companies and consultants manufacturers of geotechnical construction plants and software suppliers and developers of geotechnical construction methods

Solution of Superlarge Problems in Computational Mechanics

James H. Kane, 2012-12-06 There is a need to solve problems in solid and fluid mechanics that currently exceed the resources of current and foreseeable supercomputers The issue revolves around the number of degrees of freedom of simultaneous equations that one needs to accurately describe the problem and the computer storage and speed limitations which prohibit such solutions The goals of this symposium were to explore some of the latest work being done in both industry and academia to solve such extremely large problems and to provide a forum for the discussion and prognostication of necessary future directions of both man and machine As evidenced in this proceedings we believe these goals were met Contained in this volume are discussions of iterative solvers and their application to a variety of problems e g structures fluid dynamics and structural acoustics iterative dynamic substructuring and its use in structural acoustics the use of the boundary element method both alone and in conjunction with the finite element method the application of finite difference methods to problems of incompressible turbulent flow and algorithms amenable to concurrent computations and their applications Furthermore discussions of existing computational shortcomings from the big picture point of view are presented that include recommendations for future work
