Aging and Hearing Karen S. Helfer, Edward L. Bartlett, Arthur N. Popper, Richard R. Fay, 2020-10-20 Since the first edition of the *Aging Auditory System* volume in 2009 there has been a tremendous amount of research in basic translational and clinical sciences related to age related changes in auditory system structure and function The new research has been driven by technical and conceptual advances in auditory neuroscience at multiple levels ranging from cells to cognition The

chapters in Aging and Hearing Causes and Consequences span a broad range of topics and appeal to a relatively wide audience. Our goal in this volume is to put together state-of-the-art discussions about new developments in aging research that will appeal to a broad audience serving as an important update on the current state of research on the aging auditory system. This update includes not only the recent research but also consideration of how human and animal studies or translational and basic research are working in tandem to advance the field. This new edition is a natural complement to the previous SHAR volume on the aging auditory system edited by Gordon Salant, Frisina, Popper, and Fay. The target audience for this volume will be graduate students, researchers, and academic faculty from a range of disciplines: psychology, hearing science, audiology, physiology, neuroscience, engineering. It also will appeal to clinical audiologists as well as to researchers working in the hearing device industry. Individuals who attend conferences sponsored by the Association for Research in Otolaryngology, Acoustical Society of America, Auditory Cognitive Neuroscience Society, American Auditory Society, Society for Neuroscience, American Speech Language and Hearing Association, and the American Academy of Audiology among others are likely to find value in the volume.

Second-Language Speech Allan James, Jonathan Leather, 2011-05-03. Language acquisition is a human endeavor par excellence. As children, all human beings learn to understand and speak at least one language, their mother tongue. It is a process that seems to take place without any obvious effort. Second language learning, particularly among adults, causes more difficulty. The purpose of this series is to compile a collection of high quality monographs on language acquisition. The series serves the needs of everyone who wants to know more about the problem of language acquisition in general and/or about language acquisition in specific contexts.

Phonology in the Bilingual and Bidialectal Lexicon Isabelle Darcy, Annie Tremblay, Miquel Simonet, 2017-07-06. A conversation between two people can only take place if the words intended by each speaker are successfully recognized. Spoken word recognition is at the heart of language comprehension. This automatic and smooth process remains a challenge for models of spoken word recognition. Both the process of mapping the speech signal onto stored representations for words and the format of the representation themselves are subject to debate. So far, existing research on the nature of spoken word representations has focused mainly on native speakers. The picture becomes even more complex when looking at spoken word recognition in a second language. Given that most of the world's speakers know and use more than one language, it is crucial to reach a more precise understanding of how bilingual and multilingual individuals encode spoken words in the mental lexicon and why spoken word recognition is more difficult in a second language than in the native language. Current models of native spoken word recognition operate under two assumptions: i) that listeners' perception of the incoming speech signal is optimal and ii) that listeners' lexical representations are accurate. As a result, lexical representations are easily activated and intended words are successfully recognized. However, these assumptions are compromised when applied to a later learned second language. For a variety of reasons, e.g., phonetic, phonological, orthographic, second language users may not perceive the speech signal

optimally and they may still be refining the motor routines needed for articulation Accordingly their lexical representations may differ from those of native speakers which may in turn inhibit their selection of the intended word forms Second language users also have to solve a larger selection challenge having words in more than one language to choose from Thus for second language users the links between perception lexical representations orthography and production are all but clear Even for simultaneous bilinguals important questions remain about the specificity and interdependence of their lexical representations and the factors influencing cross language word activation This Frontiers Research Topic seeks to further our understanding of the factors that determine how multilinguals recognize and encode spoken words in the mental lexicon with a focus on the mapping between the input and lexical representations and on the quality of lexical representations

Speech Recognition in Adverse Conditions Sven Mattys,Ann Bradlow,Matthew Davis,Sophie Scott,2013-12-19 Speech recognition in adverse conditions has been a familiar area of research in computer science engineering and hearing sciences for several decades In contrast most psycholinguistic theories of speech recognition are built upon evidence gathered from tasks performed by healthy listeners on carefully recorded speech in a quiet environment and under conditions of undivided attention Building upon the momentum initiated by the Psycholinguistic Approaches to Speech Recognition in Adverse Conditions workshop held in Bristol UK in 2010 the aim of this volume is to promote a multi disciplinary yet unified approach to the perceptual cognitive and neuro physiological mechanisms underpinning the recognition of degraded speech variable speech speech experienced under cognitive load and speech experienced by theoretically relevant populations This collection opens with a review of the literature and a formal classification of adverse conditions The research articles then highlight those adverse conditions with the greatest potential for constraining theory showing that some speech phenomena often believed to be immutable can be affected by noise surface variations or attentional set in ways that will force researchers to rethink their theory This volume is essential for those interested in speech recognition outside laboratory constraints
