Kolmogorov Complexity and Computational Complexity Osamu Watanabe, 2012-12-06 The mathematical theory of computation has given rise to two important approaches to the informal notion of complexity Kolmogorov complexity usually a complexity measure for a single object such as a string a sequence etc measures the amount of information necessary to describe the object Computational complexity usually a complexity measure for a set of objects measures the computational resources necessary to recognize or produce elements of the set The relation between these two complexity measures has been considered for more than two decades and many interesting and deep observations have been obtained In March 1990 the Symposium on Theory and Application of Minimal Length Encoding was held at Stanford University as a part of the AAAI 1990 Spring Symposium Series Some sessions of the symposium were dedicated to Kolmogorov complexity and its relations to the computational complexity

the ory and excellent expository talks were given there Feeling that due to the importance of the material some way should be found to share these talks with researchers in the computer science community I asked the speakers of those sessions to write survey papers based on their talks in the symposium In response five speakers from the sessions contributed the papers which appear in this book **Design Science Research in Information Systems: Advances in Theory and Practice**
