A nurse is assessing a client who has dehydration. Which of the following assessments is the priority?

- a. Skin turgor
- b. Urine output
- c. Weight
- d. Mental status - ANSWER Mental status

The greatest risk to this client is injury from declining mental status or a fall from worsened dehydration. Therefore, assessing the client's mental status is the priority.

A nurse is assessing a client who is using PCA following a thoracotomy. The client is short of breath, appears restless, and has a respiratory rate of 28/min. The client's ABC results are pH 7.52, PoO_2 89 mm hg, and HCO_3^- 24 mEq/L. Which of the following actions should the nurse take?

- a. Instruct the client to cough forcefully.
- b. Assist the client with ambulation.
- c. Provide calming interventions.
- d. Discontinue the PCA. - ANSWER Provide calming interventions

The client's respiratory rate is above the expected range. Calming the client should decrease the respiratory rate, which will cause the client's carbon dioxide levels to increase. This will help correct the pH imbalance.

A nurse is caring for a client who has a sodium level of 155 mEq/L. Which of the following IV fluids should the nurse anticipate the provider to prescribe?

- a. Dextrose 5% in 0.9% sodium chloride
- b. Dextrose 5% in lactated Ringer's
- c. 3% sodium chloride
- d. 0.45% sodium chloride - ANSWER 0.45% sodium chloride

A sodium level of 155 mEq/L is an indication of hypernatremia. The nurse should anticipate a prescription for a hypotonic solution. The 0.45% sodium chloride is a hypotonic solution used to provide free water and treat cellular dehydration, which promotes waste elimination by the kidneys. Dextrose 5% in 0.9% sodium chloride is a hypertonic solution. The 3% sodium chloride is a hypertonic solution. Lactated Ringer's solution contains sodium and other electrolytes and is not indicated for hypernatremia.
