The Oxford Handbook of Computational Economics and Finance Shu-Heng Chen, Mak Kaboudan, Ye-Rong Du, 2018-01-12 The Oxford Handbook of Computational

Economics and Finance provides a survey of both the foundations of and recent advances in the frontiers of analysis and action. It is both historically and interdisciplinarily rich and also tightly connected to the rise of digital society. It begins with the conventional view of computational economics including recent algorithmic development in computing rational expectations, volatility and general equilibrium. It then moves from traditional computing in economics and finance to recent developments in natural computing including applications of nature inspired intelligence, genetic programming, swarm intelligence and fuzzy logic. Also examined are recent developments of network and agent based computing in economics. How these approaches are applied is examined in chapters on such subjects as trading robots and automated markets. The last part deals with the epistemology of simulation in its trinity form with the integration of simulation, computation and dynamics. Distinctive is the focus on natural computationalism and the examination of the implications of intelligent machines for the future of computational economics and finance. Not merely individual robots but whole integrated systems are extending their immigration to the world of Homo sapiens or symbiogenesis.
