

SUPER ASTUTE

SETTING-UP THE SUPER ASTUTE

To greatly enhance the overall performance of your car, it is necessary to tune the vehicle to the track (and its surface conditions), on which you will be racing. This will ensure its best performance on race day. Make adjustments referring to the instruction manual, keeping in mind that "balance" is the key word.

1. TIRES

Tires have a great influence on the performance of the car, and are normally the first components tuned. Select the right tires for the track you are racing on. Trimming worn spikes can help maintain traction and handling.

2. TOE-IN AND TOE-OUT

Adjusting the car to toe-in a little, by pointing the wheels inward, provides the car with good straight running and moderate steering characteristics. Toe-out, which point the wheels outward, gives sharp and crisp steering. Take care not to overdo any adjustment, otherwise the resulting drag will hinder the handling of the car. Too much of either reduces performance and control. Begin with a little toe-in and work from there.

Toe-in (front)

Neutral (front)

Neutral (front)

• Temporarily remove while making adjustments.

3. CAMBER ANGLE

While taking the corners, the car is forced to go outward, causing instability. The area of contact on each tire is determined by the camber angle, and therefore the traction of the tires can be made greater or lesser by adjustment of the camber angle. To increase traction during cornering adjust camber angle to negative, and to reduce traction, adjust for positive camber.

• The vehicle will have the standard camber angle, when assembled according to the instruction manual. It is suggested that you readjust the car to your own preference and track conditions, after break-in. Lengthen the upper arm for positive camber and shorten it for negative camber angle.

Rear end camber adjustment

4. DAMPER

It is suggested that you first assemble the damper units to standard, as outlined in the instruction manual, and test run the car. If the car understeers, make the front dampers softer and the rear harder. For oversteering traits, make the front dampers harder and the rear softer. Also, you can reduce car diving tendencies during jumps by setting the front dampers hard and the rear soft. The damper units should always be adjusted to maintain a balance between the front and rear end. Excessive damping only makes the car more difficult to control.

• Damper oil also plays a very important part in enhancing overall suspension potential. Use of different types of oil enable you to adjust your damper units for any track conditions. Remember to periodically check and service damper oil to maintain performance.

ADJUSTING CENTER OF GRAVITY AT REAR END

The rear end uprights can be moved to 3 different positions, for altering the center of gravity. When the car understeers, move the uprights rearward, and for oversteer, move the uprights forward. Also remember to readjust the dampers for perfect balance.

• After position using spacers G1.

TRACTION CONTROL SYSTEM

The traction control system protects the gear train from excessive shock and breakage from sudden impact, while still maintaining traction on road surfaces. Loosen lock nut to compensate for slippery track surfaces and tighten for hard surfaces. Be careful not to overtighten lock nut since this could damage the gear. Make your adjustments according to the track conditions by test running the car.

• The lock nut allows you to adjust the torque.

GEAR RATIO

Proper gear ratios are determined by the output of the motor, type of battery used, the track conditions and its layout. This car comes with 0.5 module pitch gearing (close to 48 pitch) for efficient power transmission. Refer to the diagram for selecting a pinion gear to provide the ratio desired. It should be noted that when running on a good gripping surface, the use of a pinion gear 1 or 2 sizes smaller can more effectively use the battery power available.
