Fuel System

Fuel injectors, controlled by the ECM, are installed in the fuel rails on each side of the intake manifold. A cross-over pipe connects the two fuel rails together at the front of the manifold. A fuel valve in the cross-over pipe allows the fuel rail to be pressurized and depressurized during servicing and maintenance.

A pressure regulator on the rear of the right fuel rail controls the pressure in the fuel rails. A return line directly returns fuel from the pressure regulator back to the fuel tank.

The primary chains transmit the drive from two sprockets on the crankshaft to variable valve timing units on the intake camshafts. The secondary chains transmit the drive from the variable valve timing units to sprockets on the exhaust camshafts.
