

The background of the slide is a dark blue field filled with a complex, dense network of thin, light blue lines. These lines are interconnected and form a web-like structure. Scattered throughout this network are numerous small, bright orange dots, which appear to be nodes or points of interest within the network. The overall effect is one of a dynamic, interconnected system, possibly representing a graph or a complex network in a mathematical or computational context.

The Geometric Vein C. Davis, B. Grünbaum, F.A. Sherk, 2012-12-06 Geometry has been defined as that part of mathematics which makes appeal to the sense of sight but this definition is thrown in doubt by the existence of great geometers who were blind or nearly so such as Leonhard Euler Sometimes it seems that geometric methods in analysis so called consist in having recourse to notions outside those apparently relevant so that geometry must be the joining of unlike strands but then what shall we say of the importance of axiomatic programmes in geometry where reference to notions outside a restricted repertory is banned Whatever its definition geometry clearly has been more than the sum of its results more than the consequences of some few axiom sets It has been a major current in mathematics with a distinctive approach and a distinctive spirit A current furthermore which has not been constant In the 1930s after a period of pervasive prominence it appeared to be in decline even passed These same years were those in which H S M Coxeter was beginning his scientific work

Undeterred by the unfashionability of geometry Coxeter pursued it with devotion and inspiration By the 1950s he appeared to the broader mathematical world as a consummate practitioner of a peculiar out of the way art Today there is no longer anything that out of the way about it Coxeter has contributed to exemplified we could almost say presided over an unanticipated and dramatic revival of geometry
