

I. Introduction

Q1. A fully connected network supports full duplex communications using unidirectional links. Show that the total number of links in such a network with n nodes is given by $2 \times {}^nC_2$.

Ans: Number of links in a point to point link with n nodes is given by:

$$\frac{n(n-1)}{2}$$

For a full duplex unidirectional links, total number of links required is:

$$2 \times \frac{n(n-1)}{2}$$

$$= {}^nC_2 \times \frac{n!}{n!(n-2)!} = \frac{n!}{2!(n-2)!} = \frac{n(n-1)}{2}$$

Therefore, total number of links = $2 \times {}^nC_2$.

Q2. How are switching systems classified? In what way is stored program control superior to hard-wired control?

Ans: Switching systems are classified as follows:

1. New facilities can be added to SPC program by changing control parameters but it is virtually impossible to modify the hard-wired subsystems to provide new functionalities.
2. Hard-wired subsystems have limited capacity, but SPC has higher capacity.
3. In SPC control functions are performed by the computer or processor rather than hardware.

Q3. Estimate the bandwidth requirements of a single satellite that is to support 20 million telephone conversations simultaneously.

Ans: Each telephone conversation takes 64 kbps bandwidth.

For 20 million telephone conversations the bandwidth required is given by:

$$\begin{aligned} \text{Bandwidth} &= 20 \times 10^6 \times 64 \text{ kbps} = 20 \times 10^6 \times 64 \times 10^3 \\ &= 1280 \times 10^9 = 1.280 \text{ Gbps} \end{aligned}$$

Operations Management Solutions with NetExpert Kornel Terplan, 1998-06-09. The communications environment is rapidly changing. The barriers of traditional phone and data technologies are going to break down, and users can expect a true multimedia environment with existing services transferred and new services implemented. New suppliers such as cable companies will compete with interexchange carriers (RBOCs) and local phone companies for the market share. The differentiator is the price-performance ratio of the service under consideration. Today's migrated and new services lack powerful management solutions. **Telecom Operations Management Solutions with NetExpert** examines the most advanced products available to manage new technologies as well as addresses services such as Advanced telephony, Wireless networks, Commercial broadband, Mass market broadband, Competitive access services, Intercarrier communications, Infrastructure services. This resource also demonstrates how expert systems solve the problem of handling the large volume of data streams from numerous network components. Practical solutions support each example of an application, offering first-hand operational experience. The book provides practical examples to deploy management solutions based on NetExpert framework from Objective Systems Integrator. The framework consists of the principal modules such as a gateway to managed devices and services as well as the workstation for operators. This framework is extended by point rulesets to manage individual devices, by domain rulesets to manage device groups, by enterprise rulesets to manage complete telco services. The solution sets support all layers of telecommunication management networks such as element, network, service, and business layers. As a result, these solution sets are extremely important to both incumbent and new telco service providers. Numerous cases cover customized solutions for managing wireless networks, SONET rings, ATM, old and new phone services, broadband services, and special access services of ISPs. **Telecom Operations Management Solutions with NetExpert** describes never-before-published information about solution sets based on an expert system-based framework. **CMOS Analog Circuit Design** Phillip E.
