Abstract: This paper presents a new method for the automatic detection of the onset of a seizure. The method is based on the analysis of the non-linear properties of the EEG signal. The results show that the proposed method is able to detect the onset of a seizure with a high accuracy and a low false alarm rate.

Keywords: EEG, seizure, onset, detection, non-linear analysis.

1. Introduction

Epilepsy is a chronic neurological disorder characterized by recurrent seizures. The onset of a seizure is a critical event for the patient and the physician. The automatic detection of the onset of a seizure is a challenging task due to the non-linear and non-stationary nature of the EEG signal.

In this paper, we propose a new method for the automatic detection of the onset of a seizure. The method is based on the analysis of the non-linear properties of the EEG signal. The results show that the proposed method is able to detect the onset of a seizure with a high accuracy and a low false alarm rate.
