Burmeister,2003 This invaluable book distils the research accomplishments of Professor Fred Basolo during the five decades
when he served as a world leader in the modern renaissance of inorganic chemistry Its primary focus is on the very
important area of chemistry known as coordination chemistry Most of the elements in the periodic table are metals and most
of the chemistry of metals involves coordination chemistry This is the case in the currently significant areas of research
including organometallic homogenous catalysis biological reactions of metalloproteins and even the solid state extended
structures of new materials In these systems the metals are of primary importance because they are the sites of ligand
substitution or redox reactions In the solid materials the coordination number of the metal and its stereochemistry are of
major importance Some fifty years of research on transition metal complexes carried out in the laboratory of Professor
Basolo at Northwestern University is recorded here as selected scientific publications The book is divided into three different
major research areas each dealing with some aspect of coordination chemistry In each case introductory remarks are
presented which indicate what prompted the research projects and what the major accomplishments were Although the
research was of the academic curiosity driven type some aspects have proven to be useful to others involved in projects that
were much more applied in nature Illustrated official journal (patents) ,1929 **Journal of Applied Mechanics** ,1975
