GOOD HANDLING TECHNIQUE

'GETTING GRIPS WITH MANUAL HANDLING'

What's the problem?

More than a third of all over three-day injuries reported each year to HSE and local authorities are caused by manual handling - the transporting or supporting of loads by hand or by bodily force.

1	Think before lifting/handling Plan the lift. Can handling aids be used? Where is the load going to be placed? Will help be needed with the load? Remove obstructions such as discarded wrapping materials. For a long lift, consider resting the load midway on a table or bench to change grip.		5	Don't flex the back any further while lifting This can happen if the legs begin to straighten before starting to raise the load.	
2	Keep the load close to the waist Keep the load as close to the body for as long as possible while lifting. Keep the heaviest side of the load next to the body. If a close approach to the load is not possible, try to slide it towards the body before attempting to lift it.		6	Avoid twisting the back or leaning sideways Especially while the back is bent. Shoulders should be kept level and facing the same direction as the hips. Turning by moving the feet is better than twisting and lifting at the same time.	
3	Adopt a stable position The feet should be apart with one leg slightly forward to maintain balance (alongside the load, if it is on the ground). You should be prepared to move your feet during the lift to maintain your stability. Avoid tight clothing or unsuitable footwear, which may make this difficult.		7	Keep the head up when handling Look ahead, not down at the load, once it has been held securely. Move smoothly. The load should not be jerked or snatched as this can make it harder to keep control and can increase the risk of injury. Don't lift or handle more than can be easily managed. There is a difference between what you can lift and what you can safely lift. If in doubt, seek advice or help.	
4	Get a good hold Where possible the load should be hugged as close as possible to the body. This may be better than gripping it tightly with hands only. Start in a good position At the start of the lift, slight bending of the back, hips and knees is preferable to fully flexing the back (crouching) or fully flexing the hips and knees (squatting).		8	Put down, then adjust If precise positioning of the load is necessary, put it down first, then slide it into the desired position.
