Senèze: Life in Central France Around Two Million Years Ago Eric Delson, Martine Faure, Claude Guérin, 2025-04-09 The paleontological site of Sen ze Haute

Loire central France was discovered in 1892 inside a volcanic crater For over 40 years local peasant Pierre Philis collected fossils and sold them to French and Swiss museums The site became world famous for its well preserved skeletons of ungulates and carnivores as well as rare but well preserved remains of primates and other mammals It is considered the reference fauna for the late Villafranchian and MNQ 18 biochronological units of European mammalian evolution but the lack of provenance data made modern research difficult From 2000 2006 the multidisciplinary Franco American Sen ze Research Project undertook five seasons of major fieldwork with the goals of clarifying the age stratigraphy and taphonomy of Sen ze as well as finding additional remains especially of the less well known taxa In this volume following a history of study and summary of the new fieldwork four geological chapters consider field methods stratigraphy volcanology and dating Combining argon argon ages and paleomagnetic calibration the newly recovered fossils are shown to date between 2 20 and 2 08 Ma with concentrations ca 2 20 2 18 and 2 10 2 08 Ma significantly older than previously thought Chapters on palynology ichthyology and ornithology are followed by eight chapters on the fossil mammals The chapter on biochronology places Sen ze among other sites at the start of MNQ 18 which is estimated to end ca 1 7 Ma Of some 2200 specimens known from the site over half are cervids with bovids rhinocerotids and equids far behind According to data from palynology and the habitat preferences of the more common mammals the paleoenvironment around the Sen ze maar would have included forest woodland and grassland perhaps in a warmer and moister climate than today Taphonomic studies revealed that bones often rested a long time under water lacked any indication of carnivore attack and often displayed pathologies in their joints It is likely that most of the associated skeletons were preserved undisturbed after large mammals fell into the paleolake and drowned without being able to climb out This book responds to the long held desire of later Cenozoic paleontologists to see a modern study of a site recognized worldwide as a biochronologic reference for the Plio Pleistocene Our study required renewed fieldwork using up to date techniques of topography sedimentology stratigraphy geochronology and taphonomy The systematic paleontology chapters are based on re study of the entire body of Sen ze fossils collected during more than a century of research The volume will be of interest to paleontologists especially those concerned with the evolution of the European fauna and with the taxa studied as well as with paleoenvironmental reconstruction and biogeography It will also be of value to mammalogists interested in analyses of near modern taxa and to paleoanthropologists archaeologists and taphonomists interested in the methods utilized and the role of Sen ze as a comparative standard for a site of this age without human intervention It will surely be an essential reference for all those who want to know more about Life in Central France Around Two Million Years Ago **GIM International** ,2008 *Surveying for Engineers* J. Uren,William Frank Price,2006 Surveying engineering geomatics geospatial technology Geographic Information System GIS remote sensing *The Changing Alpine Treeline* David R. Butler,George P. Malanson,Stephen J. Walsh,Daniel B. Fagre,2009-03-13 The alpine treeline ecotone ATE is an area of transition high on mountains where closed canopy forests from lower elevations give way

to the open alpine tundra and rocky expanses above Alpine tundra is an island biome and its ecotone with forest is subject to change and like oceanic islands alpine tundra is subject to invasion or the upward advance of treeline The invasion of tundra by trees will have consequences for the tundra biome as invasion does for other island flora and fauna To examine the invasibility of tundra we take a plant's eye view wherein the local conditions become extremely important Among these local conditions we find geomorphology to be exceptionally important We concentrate on aspects of microtopography and microgeomorphology and microclimate because these are the factors that matter from the plant's eye view but we pay attention to multiple scales At coarse scales snow avalanches and debris flows are widespread and create disturbance treelines whose elevation is well below those controlled by climate At medium scales turf banked terraces create tread and riser topography that is a difficult landscape for a tree seedling to survive upon because of exposure to wind dryness and impenetrable surfaces At fine scales turf exfoliation of the fronts of turf banked risers and boulders offer microsites where tree seedlings may find shelter and are able to gain a foothold in the alpine tundra conversely however surfaces of needle ice pans and frost heaving associated with miniature patterned ground production are associated with sites inimical to seedling establishment or survival We explicitly consider how local scale processes propagate across scales into landscape patterns The objective of this book is to examine the controls on change at alpine treeline All the papers are focused on work done in Glacier National Park Montana USA Although any one place is limiting we are able to examine the alpine treeline here in some detail and an advantage is that the treeline ecotone in Glacier National Park is quite variable in itself due to the underlying variability in geomorphology at multiple scales This book will provide insights into an important ecological phenomenon with a distinctly geomorphic perspective The editors collectively have over 100 years of experience in working in geomorphology biogeography and ecology They also have each worked on research in Glacier National Park for several decades The book will be a reference for a variety of professionals and students both graduate and undergraduate with interests in Physical Geography Geomorphology Ecology and Environmental Science Because of the importance of the alpine treeline ecotone for recreation and aesthetic interests in mountain environments wildland and park managers will also use this book Subject matter geomorphology at alpine treeline Expertise of contributors each editor brings over 25 years of experience in studies of ecotones and geomorphology and collectively over 100 years of experience in Glacier National Park
