Glare and Contrast Sensitivity for Clinicians M. Princeton Nadler, David Miller, Daniel J. Nadler, 2012-12-06 There have been greater advances in our knowledge of the visual function and its disabilities in the past 50 years than had accumulated in all of the previous years This applies not only to the basic science of biochemistry physiology physiopathology and cytopathology but also to the diagnosis and treatment of visual dysfunction and ocular disease These advances have been aided by a proliferation of ingenious instruments When I began my residency in ophthalmology at The Wilmer Institute in 1938 one was supposed to learn not only the physiology of vision but also how to diagnose and treat all phases of ophthalmology including disabilities of the orbit sclera retina lens and cornea In addition he or she was supposed to understand neuro ophthalmology ophthalmic genetics and so called uveitis It soon became evident that no one could adequately comprehend all of these areas and therefore most young trainees today take a year or two of fellowship in a specialized area following their three to five year residency training Following this they join a group of other ophthalmologists and specialize Thus they become more expert in the diagnosis and treatment in a limited area in ophthalmology When I returned to The Wilmer Institute in 1955 as Head of the Department I was the only full time member of the staff To date we have some 28 full time ophthalmologists working in highly specialized areas of our institution

The Perception of Visual Information William Thomson, Peter N.T. Wells, 2013-03-09 Human knowledge is primarily the product of experiences acquired through interactions of our senses with our surroundings Of all the senses vision is the one relied on most heavily by most people for sensory input about the environment Visual interactions can be divided into three processes 1 detection of visual information 2 recognition of the external source of the information and 3 interpretation of the significance of the information These processes usually occur sequentially although there is considerable interdependence among them With our strong dependence on the processes of visual interactions we might assume that they are well characterized and understood Nothing could be further from the truth Human vision remains an enigma in spite of speculations by philosophers for centuries and more recently of attention from physicists and cognitive and experimental psychologists How we see and how we know what we see remains an unsolved mystery that challenges some of the most creative scientists and cognitive specialists
