Waltari,Kari A.I. Halonen,2005-12-30 For four decades the evolution of integrated circuits has followed Moore s law according to which the number of transistors per square millimeter of silicon doubles every 18 months At the same time transistors have become faster making possible ever increasing clock rates in digital circuits This trend seems set to continue for at least another decade without slowing down Thus in the near future the processing power of digital circuits will continue to increase at an accelerating pace For analog circuits the evolution of technology is not as beneficial Thus there is a trend to move signal processing functions from the analog domain to the digital one which besides allowing for a higher level of accuracy provides savings in power consumption and silicon area increases robustness speeds up the design process brings flexibility and programmability and increases the possibilities for design reuse In many applications the input and output signals of the system are inherently analog preventing all digital realizations at the very least a conversion between analog and digital is needed at the terfaces Typically moving the analog digital boundary closer to the outside world increases the bit rate across it In telecommunications systems the trend to boost bit rates is based on plying widerbandwidths and a higher signal to noise ratio At the same time radio architectures in many applications are evolving toward software defined radio one of the main characteristics of which is the shifting of the anal digital boundary closer to the antenna Stress Echocardiography Eugenio Picano,2023-10-19 This is the seventh edition of a long selling book first edition 1991 that was translated into Italian French Chinese Portuguese Spanish English In the last ten years stress echocardiography has exploded in its breadth and variety of applications From a one fits all approach wall motion by 2D echo in the patient with known or suspected coronary artery disease the field has progressed to an omnivorous next generation laboratory employing a variety of technologies from M Mode to 2D from pulsed continuous color and tissue Doppler to lung ultrasound on patients covering the entire spectrum of severity from elite athletes to patients with end stage heart failure and ages from children with congenital heart disease to
