Du, Shengxi Chen, Xiujun Liu, Lulu Wang, 2024-04-26 Amazing anticancer therapy advancements have been made in the last decade due to tremendous innovations. Nonetheless, drug resistance remains a major challenge that limits the effectiveness of anticancer therapies, causing cancer recurrence and metastasis and being a major cause of cancer-related death. Drug resistance can be caused by complex molecular mechanisms such as gene mutations, epigenetic dysregulation, microenvironment alterations, etc. Many clinical strategies, including combination therapies and epigenetic drugs, have been used to avoid or reverse drug resistance effectively. However, the progression of cancers in patients under treatment or the lack of response of cancer patients indicate that current approaches to overcome resistance are far from sufficient and more work is needed.

Hematology once again bridges the gap between the clinical practice of hematology and the basic foundations of science. Broken down into eight parts, this book provides readers with a comprehensive overview of Laboratory Hematology: The Normal Hematologic System, Transfusion Medicine, Disorders of Red Cells, Hemostasis and Coagulation, Benign Disorders of Leukocytes, The Spleen and/or Immunoglobulins, Hematologic Malignancies, and Transplantation. Within these sections, there is a heavy focus on the morphological exam of the peripheral blood smear, bone marrow, lymph nodes, and other tissues. With the knowledge about gene therapy and immunotherapy expanding, new up-to-date information about the process and application of these therapies is included. Likewise, the editors have completely revised material on stem cell transplantation in regards to both malignant and benign disorders, graft versus host disease, and the importance of long-term follow-up of transplantation survivors.

Precision Immunotherapy and Novel Target Discovery in Hematological Malignancy Beibei Zhang, Tuo Liu, Yu Pan, 2025-11-13

Hematological malignancies represent defying clinical conditions affecting either the lymphoid or the myeloid lineages. Targeted therapy research is developing rapidly from bench to bedside based on the continually updated disease molecular understanding and growing novel target identifications in malignancy. Patient survival expectations and clinical outcomes are closely associated with the development of precision treatments. For example, acute myeloid leukemia (AML) is a group of myeloid malignancies characterized by high heterogeneity in clinical courses and therapy responses. The emergence of new targeted agents such as FLT3, BCL2 inhibitors, or immune checkpoint blockade (ICB) therapy has significantly improved the survival of a subtype of AML. In addition, inspired by the promising outcomes of CAR T therapy in certain malignancies, various new immunotherapy technologies are emerging rapidly based on neoantigens. Nevertheless, the lack of ideal targets or neoantigens seems to be one of the major stumbling blocks in the precision immunotherapy of most hematological malignancies. Currently, developed technological innovations have driven the identification of more and more malignant disease-specific novel molecules or neoantigens that arise as diagnostic biomarkers and therapeutic targets. Thus, precision targeted immunotherapy is developing as one of the most promising approaches in the battle against these hematological malignant diseases. There is no doubt that the development of novel precision diagnoses and therapeutic approaches against these novel targets or neoantigens will outline the prospective clinical applications in the future. Given the significant clinical outcomes of novel target-based immunotherapy and uncovered mechanism understanding in hematological malignancies, the research topic welcomes studies involved in the latest developments in novel target or neoantigen discoveries and utilizations, including small chemical molecular immunomodulatory drug development, vaccines, antibodies, and cell therapies from basic preclinical research to translational studies in hematological malignancies. The main goal of this research topic is to draw a clear framework within which we can see the steps that should be taken to establish and maintain effective anti-malignancy immune responses based on novel target or neoantigen-associated immunotherapeutic approaches, which are crucial for interpreting hematological malignancy.
