

Squaring and Rooting: Inverses

Warm-Up

Solve each equation for x . Remember: These equations usually have two solutions.

A) $x^2 + 21 = 70$

B) $4x^2 - 12 = 13$

C) $(x - 3)^2 + 4 = 40$

1. Review of Quadratic Functions

A. For the equation $y = x^2$, complete the table. Then plot points to construct the graph.

B. If the domain of the equation is $\{-3, -2, -1, 0, 1, 2, 3\}$, then what would be the range?

C. Is this equation a function? Explain.

$$y = x^2$$

2. Inverse with Coordinates

A. Recall that an inverse can be formed by switching the x - and y -coordinates in a relation. Use this method to make a table and graph for the inverse of $y = x^2$.

B. Is this inverse a function? Explain.

3. Inverse with Algebra

Remember that another way to find an inverse is to switch the x and y variables in an equation, then solve for the "new" y .

A. Use this algebraic method to find the inverse of $y = x^2$.

Equation: $y = x^2$
 Inverse: $\underline{\hspace{1cm}} = \underline{\hspace{1cm}}^2$
 Solve:
 Notation: $f^{-1}(x) =$

B. Use a calculator to help you sketch the graph of this inverse equation in the box below.

Does this graph match your answer from #2? Explain.

The Greatest Horse of All Charles Justice, 2008-11-20 Using the most basic statistics completely explained the author selects the sixteen most likely candidates for the title greatest horse of the twentieth century Fifty colts and fillies listed mainly in a 1999 publication by The Blood Horse Inc were compared using a three part process This process narrowed the top contenders to sixteen The past performance data for these Thoroughbreds were obtained from the Daily Racing Form's 2000 publication Champions Using results identical to those explained in the book the author calculates that the best likely average time for Big Brown to run the upcoming Belmont is 147.54 seconds or 2:27.54 One hundred simulations at 12 furlongs based on Big Brown's current 2008 performance data and the past 36 years of Belmont winning times indicate he has a 72 percent chance of winning the triple crown The identical formulas used in the book on the past performance data for Secretariat Seattle Slew and Affirmed came within fractional seconds of predicting their Belmont Triple Crown wins Of course as most Wall Street pundits will warn past performance is not a guarantee of future performance And now in retrospect Big Brown sadly did not win Had he run as he was capable the predicted time stated above would have beaten the winner Da Tara by 2.09 seconds Charles Justice June 5 and 9 2008 Algebra and

Time-Varying Systems and Computations Patrick DeWilde, Alle-Jan van der Veen, 2013-03-09 Complex function theory and linear algebra provide much of the basic mathematics needed by engineers engaged in numerical computations signal processing or control The transfer function of a linear time invariant system is a function of the complex variable s or z and it is analytic in a large part of the complex plane Many important properties of the system for which it is a transfer function are related to its analytic properties On the other hand engineers often encounter small and large matrices which describe linear maps between physically important quantities In both cases similar mathematical and computational problems occur operators be they transfer functions or matrices have to be simplified approximated decomposed and realized Each field has developed theory and techniques to solve the main common problems encountered Yet there is a large mysterious gap between complex function theory and numerical linear algebra For example complex function theory has solved the problem to find analytic functions of minimal complexity and minimal supremum norm that approximate given values at strategic points in the complex plane They serve approximants for a desired behavior of a system to be designed No similar approximation theory for matrices existed until recently except for the case where the matrix is very close to singular

Genetics and Analysis of Quantitative Traits

Bruce Walsh, Peter M. Visscher, Michael Lynch, 2025-08-21 Almost every trait in nature shows variation both within populations and between populations and species The field of quantitative genetics is the very broad umbrella that attempts to separate environmental from genetic sources of variation As a result it has powerful applications in animal and plant breeding evolution ecology medicine anthropology behaviour population genetics conservation biology genomics and statistics This second edition of *Genetics and Analysis of Quantitative Traits* is a fully rewritten and greatly expanded revision of the first edition published in 1998 which provided the first modern unified treatment of quantitative genetics In the past two decades there have been massive advancements in the field coupled with explosive growth in new quantitative methods those developments are covered in this new edition The book weaves important biological applications with a full development of the theory and appropriate statistical tools There are extensive discussions of important linear algebra tools linear and mixed models likelihood and Bayesian estimation as well as false discovery rates multiple comparisons and meta analysis More than 100 worked examples ranging from microbes to humans illustrate the key concepts using real world applications This extensive reference will be suitable for graduate level students and professional researchers both empiricists and theoreticians in the fields of evolutionary biology genetics and genomics It will also be of particular relevance and use to applied evolutionary biologists working in breed improvement for agriculture human geneticists and statisticians
