DELAY POOL PARAMETERS

Conceptually, delay pools are bandwidth buckets - "pools" of bandwidth that don't run as people browse the Web, and Wap at the rate specified - this can be thought of as a leaky bucket that is continuously being filled. This is useful when bandwidth changes are in place, there want to reduce bandwidth usage for each bucket.

Delay Pools can be used when combined with ACLs. These tags permit us to limit the bandwidth of certain requests, based on any criteria. Delay buckets are selected by ACLs (low and high priority traffic, staff vs students or student vs authenticated student or so on). In ISPs, delay pools can be implemented in a particular network to improve the quality of service. To enable this, Squid needs to be configured with the `--enable-delay-pools` option.
