newborns with closed spinal dysraphism in whom the neurological consequences vary. A retrospective analysis detected renal damage on DMSA scintigraphy in 5 of 41 children with SD who were followed according to a proactive national program with minimal use of surgery. Median follow up time was 10 years. High baseline pressure was confirmed as a risk factor for renal damage. Compliance with treatment and follow up is likely to be an important factor for renal health. Therefore efforts to support children and their families are crucial. A questionnaire based study of 107 children with SD age 6-16y in Sweden and Norway examined aspects of treatment for neurogenic bowel dysfunction focusing on incontinence, independence, general satisfaction and quality of life. It was found that transanal irrigation (TAI) and antegrade colonic enemas (ACE) are effective treatments but are time consuming and difficult to perform independently. The majority of children using TAI (72%) and ACE (63%) never went to the toilet alone to empty their bowels. As children achieving independence on the toilet reported higher quality of life, efforts to support independence are beneficial. Continent self-managing children with healthy kidneys enjoy high quality of life and contribute more fully to society. Therefore further research is required to investigate and develop existing and new technologies and methods that mitigate the problems related to SD and to make them accessible to all children with spinal dysraphism.

Under de senaste 50 åren har det skett en enastående utveckling av möjligheterna för barn som föds med ryggmärgsbräck. Tidigare har majoriteten av barn med ryggmärgsbräck avlidit redan som spädbarn, men idag överlever de flesta till vuxen ålder. Utan aktiva insatser och uppfostring riskerar dock risken för medicinska problem och allvarlig påverkan på livet mycket stor. Nu när nästan alla barn överlever ligger fokus på att också öka livskvalitet och självständighet för personer med ryggmärgsbräck. Nästan alla med ryggmärgsbräck måste hantera en allvarlig påverkan på blåsan och tarmen med risk för njurskador, inkontinens och förstoppning. I avhandlingens två första studier valdes en metod att med minimalt obehag för barnet bedöma blåsfunktionen. Detta för att kunna skilja ut de barn som behöver genomgå mer avancerade undersökningar och följande med blåstömningen genom tarmtappningar med kateter så kallad intermittent kateterisering (RIK). När vi jämförde resultatet av testet för 50 nyfödda med ryggmärgsbräck med samma undersökning av 50 friska nyfödda fann vi stora skillnader. Mest tydligt var att de flesta nyfödda med ryggmärgsbräck (69%) men inga friska nyfödda läckte urin när man tryckte över blåsan. Av nyfödda med ryggmärgsbräck kissade de flesta (74%) inte med strål vilket alla friska nyfödda gjorde. Att inte kissa med strål talade också starkt för att barnet skulle komma att behöva följande med RIK för att tomta blåsan vid ett års ålder och där sannolikt livet ut. Sammantaget visade avhandlingens två första arbeten att den metod för bedömning av blåsfunktion vi undersökt kan användas för att styra uppfostring och behandling av nyfödda med ryggmärgsbräck. Avhandlingens tredje studie visade att aktiv uppfostring av barnen enligt ett nationellt vårdprogram lyckades förhindra njurskador hos de flesta, men att hög tryck i urinblåsan och återkommande urinvägsinfektioner ökade risken för skador i familjernas framtida liv. Att i en pressad vardag klara av att genomföra de ofta krävande behandlingar och undersökningar som rekommenderas verkade vara viktig för att förhindra njurskador. Stöttning av familjerna är därför viktig. Avhandlingens fjärde arbete berörde tarmen som nästan alltid påverkas vid
