Ultrasound Guided Adductor Canal Block:

EVALUATION OF ULTRASOUND-GUIDED ADDUCTOR CANAL BLOCK WITH TWO DIFFERENT CONCENTRATION OF BUPIVACAINE IN ARTHROSCOPIC KNEE SURGERY, CONTROLLED RANDOMIZED PROSPECTIVE STUDY. ,2017

Background and Aims Ultrasound guided Adductor Canal Block ACB is an effective regional anesthesia technique that is often used as part of multimodal analgesia in knee surgeons In this study we aimed to determine ACB activity with bupivacaine in two different concentrations by comparing the control group and the block groups Methods This prospective randomized controlled double blinded study included three groups ACB 0.25 ACB 0.16 and control with 20 patients each ASA 1-2 aged 18 years due to undergo arthroscopic knee surgery All patients underwent the same general anesthesia regimen All blocks were performed pre operatively under sedo analgesia with the application of 15ml of local anesthetic 0.25 % and 0.16% respectively in experimental groups In control group no block was performed Pain intensity NRS PCA tramadol consumption and rescue analgesic requirements were noted for the first 24 hours Results There was no difference between demographic data or type of surgery While there was no difference in NRS score at any hour between the block groups tramadol consumption during the first 12 hours tramadol consumption were statistically significantly higher in the control group compared to both block groups The rescue analgesic requirement was similar in all groups Conclusions While ACB performed with concentrations of 0.25% and 0.16% bupivacaine in the same volume have the similar effect they improve analgesia quality in patients undergoing arthroscopic knee surgery when compared to a control group **Atlas of**

Long-term Analgesic Efficacy of an Ultrasound Guided Single-shot Adductor Canal Block in Patients Undergoing Total Knee Arthroplasty Yanzi Zhang, 2017 Background and objectives Both single shot and continuous adductor canal blocks ACB have shown promise in reducing postoperative pain in total knee arthroplasty TKA patients In this prospective randomized and placebo controlled study we compared analgesic efficacy when given as a single shot vs continuous technique with intermittent boluses during the postoperative period Methods 75 patients presenting for primary unilateral TKA received preoperatively an ultrasound guided single shot ACB and indwelled postoperatively an adductor canal catheter Those patients were randomly received a preoperative single shot of ropivacaine 0.5% 20ml following intermittent saline boluses at 12h and 24h postoperatively S ACB group or ropivacaine 0.5% 20ml preoperatively 12h and 24h postoperatively C ACB group or saline preoperatively and postoperatively control group The primary outcome was pain with movement on postoperative Day1 and Day2 Other endpoints included static pain scores quadriceps muscle strength rescue opioid consumption cost incurred and patient satisfaction Results Both

ACB techniques were equally effective in diminishing dynamic pain and reducing the side effects normally associated with Pethidine Hydrochloride Dynamic pain scores of the two ACB groups were lower than those of the control group S ACB C ACB vs Control group 4 0 3 0 vs 5 0 p Atlas of Ultrasound-Guided Regional Anesthesia Andrew T.
