Review Questions

1.
 - a. Law versus theory: A law is a concise statement or equation that summarizes observed behavior. A theory is a set of hypotheses that gives an overall explanation of some phenomenon. A law summarizes what happens; a theory (or model) attempts to explain why it happens.
 - b. Theory versus experiment: A theory is an explanation of why things behave the way they do, while an experiment is the process of observing that behavior. Theories attempt to explain the results of experiments and are, in turn, tested by further experiments.
 - c. Qualitative versus quantitative: A qualitative observation only describes a quality while a quantitative observation attaches a number to the observation. Some qualitative observations would be: The water was hot to the touch. Mercury was found in the drinking water. Some quantitative observations would be: The temperature of the water was 62°C. The concentration of mercury in the drinking water was 1.5 ppm.
 - d. Hypothesis versus theory: Both are explanations of experimental observation. A theory is a set of hypotheses that has been tested over time and found to still be valid, with (perhaps) some modifications.

2. The fundamental steps are

- (1) making observations;
- (2) formulating hypotheses;
- (3) performing experiments to test the hypotheses.

The key to the scientific method is performing experiments to test hypotheses. If after the test of time the hypotheses seems to account satisfactorily for some aspect of natural behavior, then the set of tested hypotheses turns into a theory (model). However, scientists continue to perform experiments to refine or replace existing theories.

3. A qualitative observation expresses what makes something what it is; it does not involve a number; e.g., the air we breathe is a mixture of gases, ice is less dense than water, rotten milk stinks.

The SI units are mass in kilograms, length in meters, and volume in the derived units of m^3 . The assumed uncertainty in a number is ± 1 in the last significant figure of the number.

4. Volume readings are estimated to one decimal place past the markings on the glassware. The assumed uncertainty is ± 1 in the estimated digit. For glassware a, the volume would be

web to apply norton s theorem to the solution of the two loop problem consider the current through resistor r_2 below replacing the remainder of the network by its norton equivalent simplifies the determination of i_2 for $r_1 = 1 \Omega$ $r_2 = 2 \Omega$ $r_3 = 3 \Omega$ and voltages $v_1 = 1 \text{ V}$ and $v_2 = 2 \text{ V}$ the open circuit voltage is v

Norton's theorem states that any linear circuit can be simplified to an equivalent circuit consisting of a single current source and parallel resistance that is connected to a load. This article explains the step by step process for determining the Norton equivalent circuit and Norton's theorem.

web general idea in circuit theory thévenin s theorem for linear electrical networks states that any combination of voltage sources current sources and resistors with two terminals is electrically equivalent to a single voltage source v in series with a single series resistor r those sources mentioned above can be either independent or dependent
