

Step-by-step guide to critiquing research. Part 1: quantitative research

Michael Coughlan, Patricia Cronin, Frances Ryan

Abstract

When caring for patients it is essential that nurses are using the current best practice. To determine what this is, nurses must be able to read research critically. But for many qualified and student nurses the terminology used in research can be difficult to understand thus making critical reading even more daunting. It is imperative in nursing that care has its foundations in sound research and it is essential that all nurses have the ability to critically appraise research to identify what is best practice. This article is a step-by-step approach to critiquing quantitative research to help nurses demystify the process and decode the terminology.

Key words: Quantitative research ■ Review process ■ Research methodologies

For many qualified nurses and nursing students research is research, and it is often quite difficult to grasp what others are referring to when they discuss the limitations and or strengths within a research study. Research texts and journals refer to critiquing the literature, critical analysis, reviewing the literature, evaluation and appraisal of the literature which are in essence the same thing (Bassett and Bassett, 2003). Terminology in research can be confusing for the novice research reader where a term like 'random' refers to an organized manner of selecting items or participants, and the word 'significance' is applied to a degree of chance. Thus the aim of this article is to take a step-by-step approach to critiquing research in an attempt to help nurses demystify the process and decode the terminology.

When caring for patients it is essential that nurses are using the current best practice. To determine what this is nurses must be able to read research. The adage 'All that glitters is not gold' is also true in research. Not all research is of the same quality or of a high standard and therefore nurses should not simply take research at face value simply because it has been published (Collum and Droogan, 1999; Polit and Beck, 2006). Critiquing is a systematic method of

appraising the strengths and limitations of a piece of research in order to determine its credibility and/or its applicability to practice (Valente, 2003). Seeking only limitations in a study is criticism and critiquing and criticisms are not the same (Burns and Grove, 1997). A critique is an impersonal evaluation of the strengths and limitations of the research being reviewed and should not be seen as a disparagement of the researchers ability. Neither should it be regarded as a jousting match between the researcher and the reviewer. Burns and Grove (1999) call this an 'intellectual critique' in that it is not the creator but the creation that is being evaluated. The reviewer maintains objectivity throughout the critique. No personal views are expressed by the reviewer and the strengths and/or limitations of the study and the implications of these are highlighted with reference to research texts or journals. It is also important to remember that research works within the realms of probability where nothing is absolutely certain. It is therefore important to refer to the apparent strengths, limitations and findings of a piece of research (Burns and Grove, 1997). The use of personal pronouns is also avoided in order that an appearance of objectivity can be maintained.

Credibility and Integrity

There are numerous tools available to help both novice and advanced reviewers to critique research studies (Tanner, 2003). These tools generally ask questions that can help the reviewer to determine the degree to which the steps in the research process were followed. However, some steps are more important than others and very few tools acknowledge this. Ryan-Wenger (1992) suggests that questions in a critiquing tool can be subdivided in those that are useful for getting a feel for the study being presented which she calls 'credibility variables' and those that are essential for evaluating the research process called 'integrity variables'.

Credibility variables concentrate on how believable the work appears and focus on the researcher's qualifications and ability to undertake and accurately present the study. The answers to these questions are important when critiquing a piece of research as they can offer the reader an insight into what to expect in the remainder of the study. However, the reader should be aware that identified strengths and limitations within this section will not necessarily correspond with what will be found in the rest of the work. Integrity questions, on the other hand, are interested in the robustness of the research method, seeking to identify how appropriately and accurately the researcher followed the steps in the research process. The answers to these questions

The Socio-Economic Benefit of Home Ownership in Low and Moderate Income Communities Thomas P. Fitzgibbon, 2010-09 The United States government spends billions of dollars on home ownership programs in low and moderate income communities However there is paucity of academic research to assess the socioeconomic impacts of these programs The purpose of this empirical research was to assess their possible impacts The key research question explored the relationship between low and moderate income home ownership the independent variable and the dependent variables of the rates of crime unemployment high school graduation and standardized test scores in the communities concerned The research design was quantitative causal Welfare economic theory formed the theoretical foundation for the study Using public records data were collected from four low and moderate income communities in major Midwestern metropolitan areas The proposed relationships were tested through independent sample t tests and regression analyses Results indicated no significant relationship between low and moderate home ownership rate and the rates of the studied socioeconomic indicators A significant social change implication of this finding would be to relocate federal dollars from housing schemes to more socially and economically relevant programs such as those geared toward improving educational opportunities in low and moderate income communities

The Impact of Organizational Capital Investment on Employee Innovation in the Manufacturing Industry Dr. Hyacinth Nwachukwu,2016-05-20 This study involved an exploration of the impact of organizational capital investment on employee innovation in the manufacturing industry The overarching question was Does organizational capital investment impact employee innovation in the manufacturing industry Organizations tend to place much emphasis on how skill drives innovation but not on how capital investment impact employee innovation The research was guided using a qualitative phenomenological case study design to probe the impact of capital investment on employee innovation Participants were selected through a convenience and purposive sampling method using the researchers personal professional network as well as the snowball method to seek participants from individuals referrals Data collection involved personal interviews audio recording and note taking The assumption was that employee innovation is not an option but a necessity because organizations compete on global fronts for resources and market share Consequently capital investment in machinery and employee innovation becomes symbiotic in nature not mutually exclusive Results showed employee innovation can be impacted and enhanced through the acquisition and application of appropriate technological capital investment The researcher recommends further research to ascertain whether the amount of organizational capital investment is proportional to the development of employee innovativeness
