Molecular Evolution and Protobiology Koichiro Matsuno, 2012-12-06 In recent years an ever increasing amount of research has been conducted on the physico chemical basis of the origin and evolution of life or protobiology Many questions are raised in this endeavor What research

methodology should be employed What sort of dependable facts are available as a firm frame of reference upon which the physico chemical origin of life or protolife could be examined Is the origin due exclusively to chance events If not what is then responsible for the origin What physical reality underlies the evolutionarily selective process leading to the origin What role does variation assume and how is it generated in the course of evolution Many research workers have pursued various avenues toward answering the stated questions Among them we believe Sidney W Fox has been playing a very unique and pivotal role over the past quarter of a century presiding over 240 man years or more of laboratory work His laboratory syntheses of thermal proteins called proteinoids and proteinoid micro spheres have emphasized the principle of the self sequencing of amino acids as a key concept of protobiological synthesis The significance of his contribution is seen in presenting the experimental evidence that the origin of life is largely due to nonrandom events This discovery marks a new epoch in the conceptual development of studying the origin of life by focusing on the molecular processes that underlied the emergence and evolution of protobiological information

Mathematical Modeling in Experimental Nutrition Andrew J. Clifford,Hans-Georg Müller,2013-11-21 Nutrients have been recognized as essential for maximum growth successful reproduction and infection prevention since the 1940s since that time the lion s share of nutrient research has focused on defining their role in these processes Around 1990 however a major shift began in the way that researchers viewed some nutrients particularly the vitamins This shift was motivated by the discovery that modest declines in vitamin nutritional status are associated with an increased risk of ill health and disease such as neural tube defects heart disease and cancer especially in those populations or individuals who are genetically predisposed In an effort to expand upon this new understanding of nutrient action nutritionists are increasingly turning their focus to the mathematical modeling of nutrient kinetic data The availability of suitably tagged isotope nutrients such as B carotene vitamin A folate among others sensitive analytical methods to trace them in humans mass spectrometry and accelerator mass spectrometry and powerful software capable of solving and manipulating differential equations efficiently and accurately has allowed researchers to construct mathematical models aimed at characterizing the dynamic and kinetic behavior of key nutrients in vivo in humans at an unparalleled level of detail
