Application Development Systems Tosiyasu L. Kunii, 2012-12-06. Applications are the parts of computer systems which directly satisfy users' requirements for information processing. Effective development of applications is the key to the success of any computer-related project. This is why the dominant part of investment in computer systems development is dedicated to applications. However, little work has been published so far on how to develop applications effectively. *Application Development Systems* directly resolves this omission by presenting basic approaches both theoretical (e.g. methodologies and frameworks) and practical (e.g. application development tools and environments) to effective development of applications. Many world-famous cases of successful application development in the USA, Europe and Japan are also presented. From this book, the reader will gradually gain an insight into such successful cases as those of General Motors, Toyota, IBM, Yamaha, Nippon Steel, Mitsui Shipbuilding, Mitsui Bank and Xerox. This book has taken over 4 years to compile and edit. Indeed, without the contribution of many leading figures in academic fields and industry and the support of IBM Japan and IBM World Trade, this task could not have been achieved. Three consecutive IBM Computer Science Symposia in 1983, 1984 and 1985 were dedicated to the theme of application development. All the contributions from these symposia were reviewed and revised several times before being made into this volume.

The work consists of 52 chapters by 73 authors and is organized into seven sections. In the first section, the cognitive and information processing aspects of HCI are summarized. The following group of papers deals with design principles for software and hardware. The third section is devoted to differences in performance between different users and computer-aided training and principles for design of effective manuals. The next part presents important applications: text editors and systems for information retrieval as well as issues in computer-aided engineering, drawing and design, and robotics. The fifth section introduces methods for designing the user interface. The following section examines those issues in the AI field that are currently of greatest interest to designers and human factors specialists, including such problems as natural language interface and methods for knowledge acquisition. The last section includes social aspects in computer usage, the impact on
